Date: November 2022

Kernel Modeling Language (KerML)

Version 1.0
Release 2022-10

Submitted in partial response to Systems Modeling Language (SysML®) v2 RFP (ad/2017-12-02) by:

88Solutions Corporation	Lockheed Martin Corporation
Dassault Systèmes	MITRE
GfSE e.V.	Model Driven Solutions, Inc.
IBM	PTC
INCOSE	Simula Research Laboratory AS
Intercax LLC	Thematix Partners

0 Submission Introduction

0.1 Submission Overview

This document is the first of two documents submitted in response to the Systems Modeling Language (SysML®) v2 Request for Proposals (RFP) (ad/2017-11-04). This document defines a *Kernel Modeling Language (KerML)* that provides a syntactic and semantic foundation for creating application specific modeling languages. The second document specifies the *Systems Modeling Language (SysML), version 2.0*, built on this foundation.

Even though both documents are being submitted together to fulfill the requirements of the RFP, the present document for KerML is proposed as a separate specification from SysML v2. KerML provides a common basis for creation of new modeling languages (or evolution of existing modeling languages). It moves beyond the syntactic interoperability offered by MOF to the possibility of diverse modeling languages that are tailored to specific applications while maintaining fundamental semantic interoperability.

0.2 Submission Submitters

The following OMG member organizations are jointly submitting this proposed specification:

- 88Solutions Corporation
- Dassault Systèmes
- GfSE e.V.
- IBM
- INCOSE
- Intercax LLC
- Lockheed Martin Corporation
- MITRE
- Model Driven Solutions, Inc.
- PTC
- Simula Research Laboratory AS
- Thematix Partners

The submitters also thankfully acknowledge the support of over 60 other organizations that participated in the SysML v2 Submission Team (SST).

0.3 Submission - Issues to be discussed

6.7.1 Proposals shall describe a proof of concept implementation that can successfully execute the test cases that are required in 6.5.4.

The SST is developing a pilot implementation of the full KerML abstract syntax and textual concrete syntax. This is publicly available under an open source license at https://github.com/Systems-Modeling.

The pilot implementation is being incrementally developed along with each draft release of this document. Since the conformance test suite has not been developed yet, it is not possible to formally demonstrate the conformance of the implementation to the proposed specification. Nevertheless, the majority of this proposed specification describes the language as it has been implemented.

6.7.2 Proposals shall provide a requirements traceability matrix that demonstrates how each requirement in the RFP is satisfied. It is recognized that the requirements will be evaluated in more detail as part of the submission process. Rationale should be included in the matrix to support any proposed changes to these requirements.

See subclause 0.4 in the proposed *Systems Modeling Language (SysML), Version 2.0* specification document submitted along with the present document.

6.7.3 Proposals shall include a description of how OMG technologies are leveraged and what proposed changes to these technologies are needed to support the specification.

As required in the SysML v2 RFP, the abstract syntax for KerML is defined as a model that is consistent with the OMG Meta Object Facility [MOF] as extended with MOF Support for Semantic Structures [SMOF] (see 8.3). This also allows KerML models represented in the KerML abstract syntax to be interchanged using OMG XML Metadata Interchange [XMI].

The OMG MOF standard has been used to define many OMG-standardized modeling languages, and the KerML language definition is also built on it. However, MOF and XMI only standardize the means for specifying the abstract syntax of a modeling language and interchanging models so specified. Even SMOF provides only limited additional support for the syntactic structures required for so-called "semantic" languages.

The goal of KerML is to go beyond this and to become a new OMG standard providing application-independent syntax *and semantics* for creating more specific modeling languages (as described further in Clause 1). This will allow not only syntactic interchange between modeling tools, but also semantic interoperability. The KerML specification is being submitted as part of the SysML v2 submission, because the SST has built SysML v2 on KerML in exactly this way.

0.4 Language Requirement Tables

See subclause 0.4 of the proposed *Systems Modeling Language (SysML), Version 2.0* specification document submitted along with the present document.

1 Scope

The Kernel Modeling Language (KerML) is a application-independent modeling language with a well-grounded formal semantics for modeling existing or planned systems. The language includes general syntactic constructs for structuring models, such as relationships, annotations and namespaces; core semantics constructs that have semantics based on classification; and additional constructs for commonly needed modeling capabilities, such as associations and behaviors.

System models are expressed in KerML using a textual concrete syntax. This can be parsed to an abstract syntax representation, which is then given a semantic interpretation for the system being modeled. The semantics for the KerML core constructs is grounded in formal mathematical logic, providing a consistent basis for mathematical reasoning about KerML models. However, beyond this, the semantics of KerML constructs are specified by the relationship of user model elements to the KerML Semantic Library.

The Semantic Library models, also expressed in KerML, provide an ontological model of the meaning of KerML models. Indeed, all KerML models can be semantically expressed using solely core modeling constructs referencing the appropriate semantic concepts defined in the Semantic Library. KerML semantic constructs beyond the core are essentially just syntactic conveniences for reusing specific library concepts: structures for modeling *objects*, behaviors for modeling *performances*, associations for modeling *links*, etc.

Indeed, the full KerML language can be considered to be simply a syntactic extension of the core, which is semantically extended using library models. By intent, this approach that can also be used to build on KerML to create more specific modeling languages. Application specific modeling languages can be built on KerML by extending the KerML abstract syntax, specializing its semantics, with concrete syntaxes similar to or entirely different from KerML's.

To support this, the KerML Semantic Library also includes additional library models beyond those directly providing semantics for KerML syntactic constructs, capturing typical semantic patterns (such as asynchronous transfers and state-based behavior) that can be reused by languages built on KerML. Specialized modeling languages can provide additional syntax for these libraries, tailored to their applications, with semantics based largely or entirely on the KerML libraries.

In this way, KerML can provide the kernel for a family of syntactically diverse but semantically integrated modeling languages.

2 Conformance

This specification defines the Kernel Modeling Language (KerML), a language used to construct *models* of (real or virtual, planned or imagined) things. The specification includes this document and the content of the machine-readable files listed on the cover page. If there are any conflicts between this document and the machine-readable files, the machine-readable files take precedence.

A *KerML model* shall conform to this specification only if it can be represented according to the syntactic requirements specified in Clause 8. The model may be represented in a form consistent with the requirements for the KerML concrete syntax, in which case it can be parsed (as specified in Clause 8) into an abstract syntax form, or may be represented only in an abstract syntax form (see also 8.2 and 8.3).

A *KerML modeling tool* is a software application that creates, manages, analyzes, visualizes, executes or performs other services on KerML models. A tool can conform to this specification in one or more of the following ways.

1. *Abstract Syntax Conformance.* A tool demonstrating Abstract Syntax Conformance provides a user interface and/or API that enables instances of KerML abstract syntax metaclasses to be created, read, updated, and deleted. The tool must also provide a way to validate the well-formedness of models that corresponds to the constraints defined in the KerML metamodel. A well-formed model represented according to the abstract syntax is syntactically conformant to KerML as defined above. (See Clause 8.)

2. *Concrete Syntax Conformance.* A tool demonstrating Concrete Syntax Conformance provides a user interface and/or API that enables instances of KerML concrete syntax notation to be created, read, updated, and deleted. Note that a conforming tool may also provide the ability to create, read, update and delete additional notational elements that are not defined in KerML. Concrete Syntax Conformance implies Abstract Syntax Conformance, in that creating models in the concrete syntax acts as a user interface for the abstract syntax. However, a tool demonstrating Concrete Syntax Conformance need not represent a model internally in exactly the form modeled for the abstract syntax in this specification. (See Clause 8.)

3. *Semantic Conformance.* A tool demonstrating Semantic Conformance provides a demonstrable way to interpret a syntactically conformant model (as defined above) according to the KerML semantics, e.g., via model execution, simulation, or reasoning, when and only when such interpretations are possible. Semantic Conformance implies Abstract Syntax Conformance, in that the semantics for KerML are only defined on models represented in the abstract syntax. (See Clause 8 and Clause 9. See also 6.1 for further discussion of the interpretation of models and their syntactic and semantic conformance.)

4. *Model Interchange Conformance.* A tool demonstrating model interchange conformance can import and/or export syntactically conformant KerML models (as defined above) as specified in Clause 10.

Every conformant KerML modeling tool shall demonstrate at least Abstract Syntax Conformance and Model Interchange Conformance. In addition, such a tool may demonstrate Concrete Syntax Conformance and/or Semantic Conformance, both of which are dependent on Abstract Syntax Conformance.

For a tool to demonstrate any of the above forms of conformance, the tool shall pass the relevant tests from the Conformance Test Suite specified in Annex A.

4 Terms and Definitions

There are no terms and definitions specific to this specification.

5 Symbols

There are no symbols defined in this specification.

6 Introduction

6.1 Language Architecture

Developing systems generally involves creating a number of different specifications. For instance, a requirements specification gives the intended effects of a system, while a design specification determines how the system will bring about those effects. Many designs might be developed and evaluated against the same requirements. A test specification then describes test procedures that check whether requirements are met be real or virtual systems built and operated according to some design.

A *model* is a representation in some *modeling language* of all or part of any of the above kinds of system specification. The *semantics* of such models defines what it means for real or virtual things in a modeled system to conform to the specification given by the model. KerML is a foundational modeling language for expressing various kinds of system models with a consistent semantics.

Syntactically, KerML is divided into three layers, with each layer building increasingly more specific constructs on the previous layer. These layers are, from general to specific:

1. The *Root Layer* includes the most general syntactic constructs for structuring models, such as elements, relationships, annotations, and packaging.
2. The *Core Layer* includes the most general constructs that have semantics based on *classification*.
3. The *Kernel Layer* provides commonly needed modeling capabilities, such as associations and behavior.

The Core Layer grounds KerML semantics by interpreting it using mathematical logic. However, additional semantics are then specified through the relationship of Kernel abstract syntax constructs to model elements in the *Kernel Semantic Library,* which is written in KerML itself. Models expressed in KerML thus essentially reuse elements of the Semantic Library to give them semantics. The Semantic Library models give the basic conditions for the conformance of modeled things to the model, which are then augmented in the user model as appropriate.

Having a consistent specification of semantics helps people interpret models in the same way. In particular, because the Semantic Library models are expressed in the same language as user models, engineers and tool builders can inspect the library models to formally understand what real or virtual effects are actually being specified by their models for systems being modeled. More uniform model interpretation improves communication between everyone involved in modeling, including modelers and tool builders.

6.2 Document Organization

The remainder of this document is organized into four major clauses.

- Clause 7 describes KerML from a user point of view, covering all the modeling constructs in the language. It is an informative reference for the normative language specification given in the following three subclauses.
- Clause 8 specifies the normative metamodel for the KerML language. This includes the complete grammar for the concrete syntax, which is a textual notation (see 8.2), the abstract syntax, which is a MOF model (see 8.3), and formal semantics (see 8.4).
- Clause 9 specifies the normative Kernel Model Libraries, each of which is a set of *library models* available to be used in all KerML user models. They include the Semantic Library, which is a set of KerML models used to provide Kernel-layer semantics to user models (see 9.2), the Data Type Library of standard data types (see 9.3) and the Function Library of functions on those data types (see 9.4).
- Clause 10 describes each of the format used to provide standard file-based interchange of KerML models between tools.

In addition, Annex A defines the suite of conformance tests that may be used to demonstrate the conformance of a modeling tool to this specification (see also Clause 2).

6.3 Acknowledgements

This specification represents the work of many organizations and individuals. The Kernel Model Language concept, as developed for use with SysML v2, is based on earlier work of the KerML Working Group, which was led by:

- Conrad Bock, US National Institute of Standards and Technology (NIST)
- Charles Galey, Jet Propulsion Laboratory
- Bjorn Cole, Lockheed Martin Corporation

The primary authors of this specification document and the syntactic and library models described in it are:

- Ed Seidewitz, Model Driven Solutions
- Conrad Bock, US National Institute of Standards and Technology (NIST)
- Bjorn Cole, Lockheed Martin Corporation
- Ivan Gomes, Twingineer
- Hans Peter de Koning, DEKonsult

The specification was formally submitted for standardization by the following organizations:

- 88Solutions Corporation
- Dassault Systèmes
- GfSE e.V.
- IBM
- INCOSE
- Intercax LLC
- Lockheed Martin Corporation
- MITRE
- Model Driven Solutions, Inc.
- PTC
- Simula Research Laboratory AS
- Thematix Partners LLC

However, work on the specification was also supported by over 120 people in over 60 other organizations that participated in the SysML v2 Submission Team (SST). The following individuals had leadership roles in the SST:

- Manas Bajaj, Intercax LLC (API and services development lead)
- Yves Bernard, Airbus (v1 to v2 transformation co-lead)
- Bjorn Cole, Lockheed Martin Corporation (metamodel development co-lead)
- Sanford Friedenthal, SAF Consulting (SST co-lead, requirements V&V lead)
- Charles Galey, Lockheed Martin Corporation (metamodel development co-lead)
- Karen Ryan, Siemens (metamodel development co-lead)
- Ed Seidewitz, Model Driven Solutions (SST co-lead, pilot implementation lead)
- Tim Weilkiens, oose (v1 to v2 transformation co-lead)

The specification was prepared using CATIA No Magic modeling tools and the OpenMBEE system for model publication (http://www.openmbee.org), with the invaluable support of the following individuals:

- Tyler Anderson, No Magic/Dassault Systèmes
- Christopher Delp, Jet Propulsion Laboratory
- Ivan Gomes, Twingineer
- Doris Lam, Jet Propulsion Laboratory

- Robert Karban, Jet Propulsion Laboratory
- Christopher Klotz, No Magic/Dassault Systèmes
- John Watson, Lightstreet Consulting

7 Language Description

(Informative)

7.1 Language Description Overview

This clause provides an informative description of KerML. Clause 8 gives the full definition of the KerML metamodel, which is the normative specification for implementing the language. In contrast, the description in this clause focuses on how the various constructs of the language are used, along with the Kernel Model Library (see Clause 9), to construct models. While non-normative, it is intended to be precise and consistent with the normative specification of the language.

The following subclauses present the language features in each of the Root, Core and Kernel Layers of KerML (as described in 6.1). Each layer is then further subdivided, following a parallel structure to the packaging of the metamodel (see 8.1). Each subclause within a layer includes references to the corresponding concrete syntax, abstract syntax and semantics subclauses from the normative metamodel specification. In this way, the clause can be used as a general reference for KerML as well as a guide for better understanding the formal specification of the metamodel.

This clause contains many examples of the KerML textual notation. In order to distinguish this text from normal body text, the following stylistic conventions are used in this clause.

1. Textual notation appears in "`code`" font. This includes references to individual element names from both example models (such as `Vehicle` and `wheels`) and the Kernel Model Library (such as `Performance` and `performances`), as well as more extensive model snippets.
2. Keywords appear in **`boldface`**, both when referenced in-line in body text ("Features are declared using the **`feature`** keyword.") and when used within complete notation examples.
3. Longer samples of textual notation are written in separate paragraphs, indented relative to body paragraphs.

7.2 Root

7.2.1 Root Overview

The Root layer provides the most general syntactic capabilities of the language: elements and relationships between them, annotations of elements, and membership of elements in namespaces. These capabilities are the syntactic foundation for structuring models in KerML, but they do not actually represent anything about a modeled system, and so have no semantic specification. The Core and Kernel layers build on the foundation provided by Root to provide constructs with modeling semantics (see 7.3 and 7.4).

7.2.2 Elements and Relationships

7.2.2.1 Elements and Relationships Overview

Metamodel references:

- *Concrete syntax, 8.2.3.1*
- *Abstract syntax, 8.3.2.1*
- *Semantics, none*

Elements are the constituents of a model. Some elements represent *relationships* between other elements, known as the *related elements* of the relationship. In general terms, a model is constructed as a graph structure in which relationships form the edges connecting non-relationship elements constituting the nodes. However, since

relationships are themselves elements, it is also possible in KerML for a relationship to be a related element in a relationship and for there to be relationships between relationships.

One of the related elements of a relationship may be the *owning* related element of the Relationship. If the owning related element of a relationship is deleted from a model, then the relationship is also be deleted. Some of the related elements of a relationship (distinct from the owning related element, if any) may be *owned* related elements. If a relationship has owned related elements, then, if the relationship is deleted from a model, all its owned related elements are also deleted.

The *owned relationships* of an element are all those relationships for which the element is the owning related element. The *owned elements* of an element are all those elements that are owned related elements of the owned relationships of the element (notice the extra level of indirection through the owned relationships). The *owning relationship* of an element (if any) is the relationship for which the element is an owned related element (of which the element can have at most one). The *owner* of an element (if any) is the owning related element of the owning relationship of the element (again, notice the extra level of indirection through the owning relationship).

The deletion rules for relationships imply that, if an element is deleted from a model, then all its owned relationships are also deleted and, therefore, all its owned elements. This may result in a further cascade of deletions until all deletion rules are satisfied. An element that has no owner acts as the *root element* of an *ownership tree structure,* such that all elements and relationships in the structure are deleted if the root element is deleted. Deleting any element other than the root element results in the deletion of the entire subtree rooted in that element.

7.2.2.2 Elements

Every element has a unique identifier known as its *element ID*. The properties of an element can change over its lifetime, but its element ID does not change after the element is created. An element may also have additional identifiers, its *alias IDs,* which may be assigned for tool-specific purposes.

The KerML notation, however, does not have any provision for specifying element or alias IDs, since these are expected to be managed by the underlying modeling tooling. Instead, an element may also have a *name* and/or a *short name,* by which it can be referenced in the notation. While the language makes no formal distinction between names and short names, the intent is that the name of an element should be fully descriptive, particularly in the context of the definition of the element, while the short name, if given, should be an abbreviated name useful for referring to the element. (For further discussion of naming, see also 7.2.4).

An element in its simplest form, not representing any more specialized modeling construct, is notated using the keyword **`element`**. The declaration of an Element may also specify a short name and/or name for it, in that order. The short name is distinguished by being surrounded by the delimiting characters < and >. (The notation does not have any provision for specifying the element ID, since this is expected to be managed by the underlying modeling tooling.)

```
element <e145> MyName;
```

Note that it is not required to specify either a short name or a name for an element. However, unless at least one of these is given, it is not possible to reference the element from elsewhere in the textual notation.

Names and short names have the same lexical structure, which has two variants.

1. A *basic name* is one that can be lexically distinguished in itself from other parts of the notation. The initial character of a basic name must be a lowercase letter, an uppercase letter or an underscore. The remaining characters of a basic name can be any character allowed as an initial character or any digit. However, a reserved keyword may not be used as a name, even though it has the form of a basic name (see 8.2.2.6 for the list of reserved words).

```
Vehicle
power_line
```

2. An *unrestricted name* provides a way to represent a name that contains any character. It is represented as a non-empty sequence of characters surrounded by single quotes. The name consists of the characters *within* the single quotes – the single quotes are *not* included as part of the represented name. The characters within the single quotes may not include non-printable characters (including backspace, tab and newline). However, these characters may be included as part of the name itself through use of an escape sequence. In addition, the single quote character or the backslash character may only be included within the name by using an escape sequence.

   ```
   '+'
   'circuits in line'
   'On/Off Switch'
   ```

   An *escape sequence* is a sequence of two text characters starting with a backslash as an escape character, which actually denotes only a single character (except for the newline escape sequence, which represents however many characters is necessary to represent an end of line in a specific implementation). Table 4 in subclause 8.2.2.3 shows the meaning of the allowed escape sequences.

In addition to the declaration notated as above, the representation for an Element may include a *body,* which is a list of *owned* elements delimited by curly braces `{...}`. It is a general principle of the KerML textual concrete syntax that the representation of owned elements are nested inside the body of the representation of the owning element. In this way, when the notation for the owning Element is removed in its entirety from the representation of a model, the owned elements are also removed.

It is possible to specify the following owned Elements as part of the body of an Element:

- Owned (generic) relationships (see 7.2.2.3), using the keyword **`relationship`**. The containing element becomes the owning related element and the sole source for the relationship, with one or more other elements identified as target elements.
- Owned comments (see 7.2.3.2), using the keyword **`comment`** or the keyword **`doc`**. The containing element becomes the owning related element for an annotation relationship to the comment or documentation.
- Owned textual representations (see 7.2.3.3), using the keyword **`rep`** or **`language`**. The containing element becomes the owning related element for an annotation relationship to the textual representation.
- Owned metadata features (see 7.4.13), using the keyword **`metadata`** or the symbol `@`. The containing element becomes the owning related element for the annotation relationship to metadata feature. (Note that metadata annotations are a Kernel layer capability.)

```
element A {
    comment /* Element A is related to element B. */
    relationship to B;
}
element B {
    language "HTML"
        /* <a href="https://plm.elsewhere.com/part?id="1234"/> */
}
```

7.2.2.3 Relationships

The related elements of a relationship are divided into *source* and *target* elements. A relationship is said to be *directed* from its source elements to its target elements. It is allowed for a relationship to have only source or only target elements. However, by convention, an *undirected* relationship is usually represented as having only target elements.

A relationship must have at least two related elements. A relationship with exactly two related elements is known as a *binary relationship*. A *directed binary relationship* is a binary relationship in which one related element is the source and one is the target. Most specialized kinds of relationship in KerML are directed binary relationships (the principal exceptions being associations and connectors, see 7.4.5 and 7.4.6).

A relationship can be declared using the keyword **relationship**. As for a generic Element (see 7.2.2.2), a short name and/or a name may be specified for the relationship. The (unowned) source elements of the relationship are then listed after the keyword **from**, while the target elements are listed after the keyword **to**. It is allowable for a relationship to have only source elements or only target elements, but there must be at least two elements specified across the source and target lists (though some of the target elements may be owned related elements, see below).

```
element <'1'> A;
element <'2'> B;
element <'3'> C;
relationship <'4'> R from '1' to B, C;
```

The top-level Elements of a model are implicitly declared within a *root namespace* (see 7.2.4). If the model is further organized into a complete namespace structure, then elements may be identified using qualified names according to that structure (see 8.2.3.3.4 for the rules on the resolution of qualified names).

```
namespace N1 {
    element S;
}
namespace N2 {
    element T;
}
relationship from N1::S to N2::T;
```

A relationship may have a body that specifies the owned related elements of the relationship, which may include any kind of element other than an annotating element (see 7.2.3). If an annotating element (i.e., a comment, textual representation or metadata feature) is included in the body of a relationship, then, rather than being directly an owned related element of the containing relationship, the annotating element is an owned related element of an annotation relationship owned by the containing relationship.

To specify that a relationship has an owning related element, use the nested owned relationship notation (see 7.2.2.2).

```
element A;
element B {
    relationship x {
        element y; // Owned related element
        relationship from A to B; // Relationship as owned related element
    }
}
relationship R from A to B {
    /* This comment is owned via an annotation relationship,
     * so the containing relationship has no owned related elements.
     */
}
```

7.2.3 Annotations

7.2.3.1 Annotations Overview

Metamodel references:

- *Concrete syntax, 8.2.3.2*

- *Abstract syntax, 8.3.2.2*
- *Semantics, none*

An *annotation* is a relationship between an *annotated element* and an *annotating element* that provides additional information about the element being annotated. Any kind of element may be annotated, but only certain kinds of elements may be annotating elements. Specific kinds of annotating elements include comments and textual representations (see 7.2.3.2 and 7.2.3.3). A further kind of annotating element for user-defined metadata is defined in the Kernel layer (see 7.4.13).

Each annotation relationship is between a single annotating element and a single annotated element, but an annotating element may have multiple annotation relationships with different annotated elements, and any element may have multiple annotations. The annotated element of an annotation can optionally be the owning related element of the annotation, in which case the annotation is an owned annotation of the owning annotated element. If an annotating element is an owned member of a namespace (see 7.2.4) and is not involved in any annotation relationships, then its owning namespace is considered to be its annotated element without the need for an explicit annotation relationship.

7.2.3.2 Comments and Documentation

A *comment* is an annotating element with a textual `body` that in some way describes its annotated element. *Documentation* is a kind of comment that has the special status of documenting the annotated element, known in this case as the *documented element*. A documentation comment is always an owned element of its documented element.

The full declaration of a comment begins with the keyword **`comment`**, optionally followed by a short name and/or name (see 7.2.2.2). One or more annotated elements are then identified for the comment after the keyword **`about`**, indicating that the comment has annotation relationships to each of the identified elements. The `body` of the comment is written lexically as regular comment text between `/*` and `*/` delimiters (see also 8.2.2.2).

```
element A;
element B;
comment Comment1 about A, B
    /* This is the comment body text. */
```

If the comment is an owned member of a namespace (see 7.2.4), then the explicit identification of annotated elements can be omitted, in which case the annotated element is implicitly the containing namespace. Further, in this case, if no short name or name is given for the comment, then the **`comment`** keyword can also be omitted.

```
namespace N {
    comment C /* This is a comment about N. */

    /* This is also a comment about N. */
}
```

A documentation comment is notated similarly to a regular comment, but using the keyword **`doc`** rather than **`comment`**. The documenting element of a documentation comment is always the owning element of the documentation.

```
element X {
    doc X_Comment
        /* This is a documentation comment about X. */
    doc /* This is more documentation about X. */
}
namespace P {
    doc P_Comment /* This is a documentation comment about P. */
}
```

The actual `body` text of a comment does not include the initial `/*` and final `*/` characters. Further, the written text is processed to allow formatting using * characters to delimit consistent initial indentation of a comment lines. For example, the comment notation in:

```
namespace CommentExample {
    /*
     * This is an example of multiline
     * comment text with typical formatting
     *     for readable display in a text editor.
     */
}
```

would result in the following body text in the comment element in the represented model:

```
This is an example of multiline
comment text with typical formatting
    for readable display in a text editor.
```

The body text of a comment can include markup information (such as HTML), and a tool may (but is not required to) display such text as rendered according to the markup. (See 8.2.3.2.2 for the complete rules for processing comment text.)

7.2.3.3 Textual Representations

A textual representation is an annotating element whose textual `body` represents its annotated element (known in this case as the *represented element*) in a given language. A textual representation is notated similarly to a documentation comment (see 7.2.3.2), but with the keyword **`rep`** used instead of **`comment`**. As for documentation, a textual representation is always owned by its represented element. In particular, if the textual representation is an owned member of a namespace (see 7.2.4), the represented element is the containing Namespace. A textual representation declaration must also specify the language used for the textual body as a literal string (see 8.2.2.5) following the keyword **`language`**. If the textual representation has no short name or name, then the **`rep`** keyword can also be omitted.

```
class C {
    feature x: Real;
    inv x_constraint {
        rep inOCL language "ocl"
        /* self.x > 0.0 */
    }
}
behavior setX(c : C, newX : Real) {
    language "alf"
        /* c.x = newX;
         * WriteLine("Set new x");
         */
}
```

The lexical comment text given for a textual representation is processed as for regular comment text (see 7.2.3.2), and it is the result after such processing that is the textual representation `body` expected to conform to the named language.

Note. Since the lexical form of a comment is used to specify the textual representation `body`, it is not possible to include comments of a similar form in the `body` text.

The language name in a textual representation is case insensitive. The name can be of a natural language, but will often be for a machine-parsable language. In particular, there are recognized standard language names.

If the language is `"kerml"`, then the body of the textual representation must be a legal representation of the represented element in the KerML textual notation. A tool can use such a textual representation to record the original KerML notation text from which an element is parsed. Other standard language names that can be used in a textual representation include "ocl" and "alf", in which case the body of the textual representation must be written in the Object Constraint Language [OCL] or the Action Language for fUML [Alf], respectively.

However, for any other language than `"kerml"`, the KerML does not define how the `body` text is to be semantically interpreted as part of the model being represented. In particular, a generic element (e.g., as in 7.2.2.2) with a textual representation in a language other than KerML is essentially a semantically "opaque" Element specified in the other language. Nevertheless, a conforming KerML tool may (but is not required to) interpret such an element consistently with the specification of the named language.

7.2.4 Namespaces

7.2.4.1 Namespaces Overview

Metamodel references:

- *Concrete syntax, 8.2.3.3*
- *Abstract syntax, 8.3.2.3*
- *Semantics, none*

A *namespace* is an element that contains other elements via *membership* relationships with those elements. The namespace is the source element and owner of the membership. The target of a membership can be any kind of element, known as the *member element* of the membership. If the membership is an *owning* membership, then the member element is known as an *owned* member element, which is the only owned related element of the membership.

A namespace may also *import* memberships from other namespaces. Further, a type, which is kind of namespace, may *inherit* memberships from other types that it specializes (see 7.3.2).

The *members* of a namespace are the member elements of all the memberships of the namespace (whether owned, imported or inherited). The *owned members* of a namespace are the owned member elements of all the owned memberships of the namespace that are owning memberships.

If an element is a member of a namespace, then any name for that element relative to the namespace is known as an *unqualified name* for that element in the namespace. If the containing namespace is not a root namespace (see 7.2.4.3), then the *qualified name* for the member element consists of a name for the containing namespace, known as the *qualifier,* followed by an unqualified name for the element. Since a namespace is an element that may itself be a member of another namespace, a qualifier may be a qualified name. Therefore, a qualified name of an element, in general, has the form of a list of unqualified names of namespaces, each relative to the previous one, followed by the unqualified name of the element in the final namespace.

A qualified name is notated as a sequence of *segment names* separated by `"::"` punctuation. An *unqualified* name can be considered the degenerate case of a qualified name with a single segment name. A qualified name is used in the KerML textual concrete syntax to identify an element that is being referred to in the representation of another element. A qualified name used in this way does not appear in the corresponding abstract syntax—instead, the abstract syntax representation contains an actual reference to the identified element. *Name resolution* is the process of determining the element that is identified by a qualified name (see 8.2.3.3.4).

Since namespaces and their members may have aliases (see 7.2.4.2), it is possible for there to be multiple qualified names for an element even if it does not itself have aliases. On the other hand, if a namespace does not have any name, then its members will have no qualified names, even if they are themselves named.

7.2.4.2 Namespace Declaration

A namespace that is not a root namespace (see 7.2.4.3), and does not represent any more specialized modeling construct (such as a type—see 7.3.2) is declared using the keyword **namespace**, optionally followed by a short name and/or name (see 7.2.2.2). The *body* of the namespace is notated as a list of representations of the content of the namespace delimited between curly braces `{...}`. If the namespace is empty, then the body may be omitted and the declaration ended instead with a semicolon.

```
namespace <'1.1'> N1; // This is an empty namespace.
namespace <'1.2'> N2 {
    doc /* This is an example of a namespace body. */
    class C;
    datatype D;
    feature f : C;
    namespace N3; // This is a nested namespace.
}
```

Declaring an element within the body of a namespace denotes that the element is an owned member of the namespace—that is, that there is an owning membership relationship between the namespace and the member element.

The *visibility* of the membership can be specified by placing one of the keywords **public**, **protected** or **private** before the public element declaration. If the membership is **public** (the default), then it is visible outside of the namespace. If it is **private**, then it is not visible. For namespaces other than types, **protected** visibility is equivalent to **private**. For types, **protected** visibility has a special meaning relating to member inheritance (see 7.3.2).

```
namespace N {
    public class C;
    private datatype D;
    feature f : C; // public by default
}
```

An *alias* for an element is a non-owning membership of the element in a namespace, which may or may not be the same namespace that owns the element. An alias name or short name is determined only relative to its membership in the namespace, and can therefore be different than the name or short name defined on the element itself. Note that the same element may be related to a namespace by multiple alias memberships, allowing the element to have multiple, different names relative to that namespace.

An alias is declared using the keyword **alias** followed by the alias short name and/or name, with a qualified name identifying the element given after the keyword **for**. The alias declaration may optionally include a body with the same syntax as for a generic **relationship** declaration (see 7.2.2.3). The visibility of the alias membership can be specified as for an owned member.

```
namespace N1 {
    class A;
    class B;
    alias <C> CCC for B {
       doc /* Documentation of the alias. */
    }
    private alias D for B;
}
```

A comment (see 7.2.3.2), including documentation, declared within a namespace body also becomes an owned member of the namespace. If no annotated elements are specified for the comment (with an **about** clause), then, by default, the comment is considered to be about the containing namespace.

```
namespace N9 {
    class A;
    comment Comment1 about A
        /* This is a comment about class A. */

    comment Comment 2
        /* This is a comment about namespace N9. */

    /* This is also a comment about namespace N9. */

    doc N9_Doc
        /* This is documentation about namespace N9. */
}
```

With the ability to specify names, short names and aliases for elements, any element can potentially have several names relative to a namespace. However, the set of names provided for any one member of a namespace must be disjoint from the set of names provided for any other member of the namespace. That is, a namespace effectively provides a "space" of names, each one of which uniquely identifies a single member element of the namespace (though there may be multiple names that identify the same element).

7.2.4.3 Root Namespaces

A *root namespace* is a namespace that has no owner. The owned members of a root namespace are known as *top-level elements*. Any element that is not a root namespace has an owner and, therefore, must be in the ownership tree of a top-level element of some root namespace.

The declaration of a root namespace is implicit and no identification of it is provided in the KerML textual notation. Instead, the body of a root namespace is given simply by the list of representations of its top-level elements.

```
doc /* This is a model notated in KerML concrete syntax. */
element A {
    relationship B to C;
}
class C;
datatype D;
feature f: C;
package P;
```

Since the notation does not provide a means for naming a root namespace, the name of a top-level element is *not* qualified by the name of its containing root namespace. The name resolution rules consider all top-level elements to be directly and globally visible without qualification (see 8.2.3.3.4). Therefore, the *fully qualified* name of an element relative to a root namespace always begins with the name of a top-level element in the root namespace, without regard to the name (if any) of the root namespace.

7.2.4.4 Imports

A namespace may *import* the visible memberships from other namespaces. The namespace that is the source of an import relationship also owns it. The namespace that is the target of an import relationship is known as the *imported* namespace. Visible memberships of an imported namespace become *imported* memberships of the owning namespace of the import relationship.

The complete set of memberships of a namespace include all its owned memberships and all its imported memberships, and the member elements of imported memberships are included in the set of members of the namespace. Various kinds of namespaces may also define additional memberships to be included in the set of memberships of that kind of namespace (for instance, the memberships of a type also include its *inherited* members – see 7.3.2) and which of those are visible (e.g., public inherited memberships).

An import is denoted using the keyword **`import`** followed by a qualified name. This specifies an import whose imported namespace is identified by the qualification part of the qualified name and whose *imported member name* is given by the the unqualified name. If the name given for the **`import`** is unqualified, then there is no imported namespace, and the given name shall be resolved in the scope of the namespace owning the import (see 8.2.3.3.4).

Such an import results in the membership of the imported namespace whose member name or short name is the given imported member name becoming an imported membership of the importing namespace. That is, the member element of this membership becomes an imported member of the imported namespace. Note that the imported member name may be an alias of the imported element in the imported namespace, in which case the element is still imported with that (alias) name.

```
namespace N2 {
    import N1::A;
    import N1::C; // Imported with name "C".
    namespace M {
        import C; // "C" is re-imported from N2 into M.
    }
}
```

If the qualified name in an import is followed by "`::*`", then the entire qualified name identifies the imported namespace. In this case, all visible memberships of the imported namespace become imported memberships of the importing namespace.

```
namespace N3 {
    // Memberships A, B and C are all imported from N1.
    import N1::*;
}
```

If the qualified name in an **`import`**, with or without a "`::*`", is further followed by "`::**`", then the import is *recursive.* Such an import is equivalent to importing all memberships as described above, followed by further recursively importing from each imported member that is itself a namespace.

```
namespace N4 {
    class A;
    class B;
    namespace M {
        class C;
    }
}
namespace N5 {
    import N4::**;
    // The above recursive import is equivalent to all
    // of the following taken together:
    //     import N4;
    //     import N4::*;
    //     import N4::M::*;
}
namespace N6 {
    import N4::*::**;
    // The above recursive import is equivalent to all
    // of the following taken together:
    //     import N4::*;
    //     import N4::M::*;
    // (Note that N4 itself is not imported.)
}
```

The *visibility* of an import can be specified by placing the keyword **public** or **private** before the import declaration. If the import is **public** (the default), then all the imported memberships become public for the importing namespace. If import is **private**, then the imported memberships become private relative to the importing namespace. An import declaration may optionally have a body, with the same syntax as for a generic **relationship** declaration (see 7.2.2.3).

```
namespace N7  {
    public import N1::A {
        /* The imported membership is visible outside N7. */
    }

    private import N4::* {
        doc /* None of the imported memberships are visible
             * outside of N7. */
    }
}
```

An import may also be declared with one or more *filter conditions*. Given as model-level evaluable Boolean expressions (see 7.4.9), listed after the imported namespace specification, each surrounded by square brackets `[... ]`. Such a filtered import is equivalent to importing an implicit package that then both imports the given imported namespace and has all the given filter conditions. The effect is such that, for a filtered import, memberships are imported if and only if they satisfy all the given filter conditions. (While filtered imports may be used in any namespace, packages and filter conditions are actually Kernel-layer concepts, because expressions are only defined in that layer. See 7.4.14.)

```
namespace N8 {
    import Annotations::*;

    // Only import elements of NA that are annotated as Approved.
    import NA::*[@Approved];
}
```

If the member name or member short name of any imported membership conflicts with the name of any owned member, or with the name of any visible membership from any other imported namespace, then the conflicting membership is *hidden* and is not included in the set of imported memberships of the importing namespace. As a result of this rule and the distinguishability rule for owned members, the names of all owned and imported members will always be distinct from each other. Any specialized kind of namespace that adds further kinds of memberships (e.g., inherited memberships of types) always maintains the property that the names of all memberships of a namespace are distinct from each other.

Implementation Note. The pilot implementation does not current check to see if one imported membership is hidden by another imported membership. Instead, if there are two imported memberships with the same name, and they are not hidden by an owned membership (or inherited membership for a type), name resolution will find first of the imported memberships with that name.

7.3 Core

7.3.1 Core Overview

The Core layer builds on the Root layer to add the minimum constructs for modeling systems as designed, built and operated. *Semantics* is about how models are interpreted as giving conditions on how things should be (i.e., as a *specification* of a modeled system) or as a reflection of how things are (i.e, as a *description* of a modeled system). KerML semantics are based on *classification:* a model has elements that classify things in the modeled system.

A *type* is the most general kind of model element that classifies things (see 8.2.4.1.1). *Classifiers* are types that classify things, such as cars, people and processes being carried out, as well as how they are related by features (see 7.3.3). *Features* are also types, classifying relations between things (see 8.2.4.3.1). In addition to simple relations between two things, KerML allows features to classify longer *chains* of relations. For example, cars owned by people who live in a particular city might be required to be registered. These cars are identified by a chain of two relations, first the ownership of the car, then the residence of the owner.

KerML also supports taxonomies of classifications using *specialization* relationships between types. All the things classified by a specialized type are also classified by the general types it is related to via specialization relationships. This means that all the things classified by a specialized type have all the features of its general types, referred to as *inheriting* features from general to specific types. KerML includes several special kinds of specialization, including *subclassification* between classifiers, *subsetting* and *redefinition* between features, and *feature typing* between a feature and another type.

7.3.2 Types

7.3.2.1 Types Overview

Metamodel references:

- *Concrete syntax, 8.2.4.1*
- *Abstract syntax, 8.3.3.1*
- *Semantics, 8.4.3.2*

Types classify things in a modeled system. The set of things classified by a type is the *extent* of the type, each member of which is an *instance* of the type. Everything being modeled is an instance of the type `Anything` from the `Base` library model (see 9.2.2).

Types give conditions for what things must be in their extent and what must not be (*sufficient* and *necessary* conditions, respectively). The simplest conditions directly identify instances that must be in or not in the extent. Other conditions can give characteristics of instances indicating they must be in or not in the extent. These conditions apply to all procedures that determine the extents of types, including logical solving, inference, and execution.

For example, a type `Car` could require every instance in its extent (everything it classifies) to have four wheels, which means anything that does not have four wheels is not in its extent (necessary condition). It does not mean all four wheeled things are in the extent (are cars), however. (Note that necessary conditions are usually stated as what must be true of all instances in the extent, even though they really only determine what is not.) Alternatively, `Car` could require all four wheeled things to be in its extent (sufficient condition).

Types are namespaces, enabling them to have members via membership relationships to other elements identified as their members (see 7.2.4). These include *inherited* memberships, which are certain memberships from the general types of their *owned specializations* (see 7.3.2.3). The member names of all inherited memberships must be distinct from each other and from the member names of all owned memberships. A membership that would otherwise be imported is also hidden by an inherited memberships with the same member name, similarly to how it would be hidden by a conflicting owned membership (see 7.2.4).

Note. Name conflicts due to inherited memberships can be resolved by redefining them to give non-conflicting member names (see 7.3.4).

7.3.2.2 Type Declaration

A type is declared using the keyword **type**, optionally followed by a short name and/or name. In addition, a type declaration defines either one or more *owned specializations* for the type (see 7.3.2.3) or a *conjugator* for the type (see 7.3.2.4). This may optionally be followed by the definition of one or more *owned disjoinings* (see 7.3.2.5).

```
type A specializes Base::Anything disjoint from B;
type C conjugates A;
```

A type is specified as *abstract* by placing the keyword **abstract** before the keyword **type**, which means that all instances of a type must also be instances of at least one (possibly indirect) specialized type (which must not be abstract, that is, must be *concrete*).

```
abstract type A specializes Base::Anything;
type A1 specializes A;
type A2 specializes A;
```

The multiplicity constrains the number of instances in the extent of a type (the *cardinality* of the extent). A multiplicity is a feature whose values are natural numbers (extended with infinity, see 9.3.2.1) that are the only ones allowed for the cardinality of its featuring type (each multiplicity is the feature of exactly one Type). A type can have at most one feature that is its multiplicity. Cardinality for classifiers is the number of things it classifies. For features that are not end features (see below), cardinality is the number of values of the feature for a specific instance of its featuring types.

Note. The semantics of multiplicity is different for features that are identified as *end features.* End Features are used primarily in the definition of associations and connectors, and the semantics of end features is discussed in conjunction with them (see 7.4.5 and 7.4.6, respectively).

The multiplicity of a type can be specified as a *range* after any identification of the Type, between square brackets `[...]`. (See 7.4.12 for a complete description of multiplicity ranges, including declaring named multiplicity features.)

```
// This Type has exactly one instance.
type Singleton[1] specializes Base::Anything;
```

The body of a type is specified as for a generic namespace, by listing the members between curly braces `{...}` (see 7.2.4.2). However, for types, *protected* members, indicated using the keyword **protected** instead of **public** or **private**, have special visibility rules for inheritance (see 7.3.2.3). A feature declared as an owned member of a type is automatically considered to be an *owned feature* of the type, related by a *feature membership*, unless its declaration is preceded by the keyword **member**, in which case it is related by regular membership (see 7.3.2.6 for details).

```
type Super specializes Base::Anything {
    private namespace N {
        type Sub specializes Super;
    }
    protected feature f : N::Sub;
    member feature f1 : Super featured by N::Sub;
}
```

The conditions that a type places on its instances (e.g., what feature it has) are always considered *necessary.* They can be indicated as *sufficient* by placing the keyword **all** after the keyword **type**. In this case, the type places additional sufficiency conditions on its instances corresponding to all the necessary conditions. For example, if `Car` requires all instances to be four-wheeled (necessary), and then is also is indicated as sufficient, its extent will include all four wheeled things and no others. (See also the discussion in 7.3.2.1.)

```
type all Car specializes MaterialThing {
    feature wheels[4] : Wheel;
}
```

7.3.2.3 Specialization

Specializations are relationships between types, identified as *specific* and *general*, indicating that all instances of the specific type are instances of the *general* one (that is, the extent of the specific type is a subset of the extent of the general one, which might be the same set). This means instances of the specific type have all the features of the general one, referred to syntactically as *inheriting* features from general to specific types. A type my participate in multiple specialization relationships, both as specific and general types.

A specialization relationship is declared using the keyword **specialization**, optionally followed by a short name and/or a name. The qualified name of the specific type, or a feature chain (see 7.3.4.6) if the specific type is such a feature, is then given after the keyword **subtype**, followed by the qualified name of the general type, or a feature chain if the general type is such a feature, after the keyword **specializes**. The symbol `:>` can be used interchangeably with the keyword **specializes**. A specialization declaration can also optionally have a relationship body (see 7.2.2.3) for, e.g., nested annotations.

```
specialization Gen subtype A specializes B;
specialization subtype x :> Base::things {
    doc /* This specialization is unnamed. */
}
```

If no `shortName` or `name` is given, then the keyword **specialization** may be omitted.

```
subtype C specializes A;
subtype C specializes B;
```

The *directsupertypes* of a type are all the general types in specializations for which the type is the specific type, and the *direct subtypes* of a type are all the specific types in specializations for which the type is the general type. *Indirect supertypes* include, recursively, the supertypes of the direct supertypes of a type, and similarly for *indirect subtypes*.

Specialization relationships can form cycles, which means all types in the cycle have the same instances (same extent). However, since all types are required to specialize the base type `Anything` (directly or indirectly), no cycle of valid types can be entirely closed, unless it includes the type `Anything`.

The *owned specializations* of a type are those specializations that are owned relationships of the type (see 7.2.2), for which the type is the *specific* type. An owned specialization of a type is defined as part of the declaration of the type, rather than in a separate declaration, by including the qualified name or feature chain of the general type in a list after the keyword **specializes** (or the symbol `:>`).

```
type C specializes A, B;
type f :> Base::things;
```

A type *inherits* all visible and protected memberships of the general types of its owned specializations. *Protected* memberships are all owned and inherited memberships of the general type whose visibility declared as **protected** (see also 7.3.2.2 on **protected** visibility; for imported memberships, protected visibility is equivalent to private). This means protected memberships are memberships that are only visible to their owning type and to (direct or indirect) specializations of it.

```
type A specializes Base::Anything {
    feature f; // Public by default.
    protected feature g;
    private feature h;
```

```
}
type B specializes A {
    // B inherits feature memberships for
    // f and g, but not h.
}
```

7.3.2.4 Conjugation

Conjugation is a relationship between types, identified as the *original* type and the *conjugated* type, indicating the conjugated type inherits visible and protected memberships from the original type, except the direction of input and output features is reversed (see 7.3.4.1 on features with direction). Features with direction **in** relative to the original type are treated as having direction **out** relative to the conjugated type, and vice versa for direction **out** treated as **in**. Features with with no direction or direction **inout** in the original type are inherited without change.

A conjugation relationship is declared using the keyword **conjugation**, followed by a short name and/or a name. The qualified name of the conjugated type, or a feature chain (see 7.3.4.6) if the conjugated type is such a feature, is then given after the keyword **conjugate**, followed by the qualified name of the original type, or a feature chain if the original type is such a feature, after the keyword **conjugates**. The symbol ~ can be used interchangeably with the keyword **conjugates**. A conjugation declaration can also optionally have a relationship body (see 7.2.2.3) for, e.g., nested annotations.

```
type Original specializes Base::Anything {
    in feature Input;
}
type Conjugate1 specializes Base::Anything;
type Conjugate2 specializes Base::Anything;
conjugation c1 conjugate Conjugate1 conjugates Original;
conjugation c2 conjugate Conjugate2 ~ Original {
    doc /* This conjugation is equivalent to c1. */
}
```

If no short name or name is given, then the keyword **conjugation** may be omitted.

```
conjugate Conjugate1 conjugates Original;
conjugate Conjugate2 ~ Original;
```

An *owned conjugation* is an owned relationship of a type (7.2.2) that is a conjugation relationship, for which the type is the *conjugated* type. An owned conjugation for a type is defined as part of the declaration of the type, rather than in a separate declaration, by including the qualified name or feature chain of the original type after the keyword **conjugates** (or the symbol ~).

```
type Conjugate1 conjugates Original;
type Conjugate2 ~ Conjugate1;
```

A type can be the conjugated type of at most one conjugation relationship, and a conjugated type cannot be the specific type in any specialization relationship.

7.3.2.5 Disjoining

Types related by *disjoining* do not share instances (instances cannot be in more than one of the extents; the extents are *disjoint*). For example, a classifier for mammals is disjoint from a classifier for minerals, and a feature for people's parents is disjoint from a feature for their children.

A disjoining relationship is declared using the keyword **disjoining**, optionally followed by a short name and/or a name. The qualified name of the first type, or a feature chain (see 7.3.4.6) if the type is such a feature, is then given after the keyword **disjoint**, followed by the qualified name of the second type, or a feature chain, if the the type is

such a feature, after the keyword **from**. A disjoining declaration can also optionally have a relationship body (see 7.2.2.3) for, e.g., nested annotations.

```
disjoining Disj disjoint A from B;
disjoining disjoint Mammal from Mineral;
disjoining disjoint Person::parents from Person::children {
    doc /* No Person can be their own parent. */
}
```

If no short name or name is given, then the keyword **disjoining** may be omitted.

```
disjoint A from B;
disjoint Mammal from Mineral;
disjoint Person::parents from Person::children;
```

An *owned disjoining* of a type is an owned relationship of the type (see 7.2.2) that is a disjoining relationship. An owned disjoining is defined as part of the declaration of the type, rather than in a separate declaration, by including the qualified name or feature chain of the disjoining type in a list after the keyword **disjoint from**, placed after any owned specializations.

```
type C specializes Anything disjoint from A, B;
type Mammal :> Animal disjoint from Mineral;
```

7.3.2.6 Feature Membership

A *feature membership* is a relationship between a type and a feature that is both a kind of owning membership and a kind of *type featuring* (see 7.3.4.8). Features related to a type via feature membership are identified as *owned features of the type*. The owning type is one of the feature's featuring types, meaning that the feature specifies a relation between the owning type and the type of the feature.

A feature that is declared within the body of a type is normally an owned feature of that type, so it automatically has that type as a featuring type (because feature membership is a kind of type featuring). This also applies to the bodies of classifiers (see 7.3.3) and features (see 7.3.4), since they are kinds of types. A feature may also be aliased in a type like any other Element (see 7.2.4), in which case it is related to the aliasing type by a regular membership relationship, not a feature membership, and, so, does not become one of the owned features of the type.

```
feature person[*] : Person;
classifier Person {
    // This declares an owned feature using a feature membership.
    feature age[1] : ScalarValues::Integer;

    // This is not a feature membership.
    alias personAlias for person;
}
```

However, if a feature declaration in the body of type is preceded by the keyword **member**, then the feature is owned by the containing type via a membership relationship, not a feature membership. In this case, the feature is *not* an owned feature of the containing type, and it does *not* automatically have the containing type as a featuring type, though it may have featuring types declared in its **featured by** list (see 7.3.4.1 on declaring the owned typings of a feature).

```
classifier A;
classifier B {
    // Feature f has B as its featuring type.
    feature f;

    // Feature g has A as its featuring type, not B.
```

```
    member feature g featured by A;
}
```

7.3.2.7 Unioning, Intersecting, and Differencing

Unioning, intersecting, and *differencing* are relationships between an owning type and a set of other types.

1. *Unioning* specifies that the owning type classifies everything that is classified by *any* of the unioned types.
2. *Intersecting* specifies that the owning type classifies everything that is classified by *all* of the intersecting types.
3. *Differencing* specifies that the owning type classifies everything that is classified by the first of the differenced types but *not* by any of the remaining types.

Since these relationships are always owned by the source type, they are defined as part of the declaration of that type, using the keywords **unions**, **intersects**, and **differences**, respectively, followed by a list of qualified names (or feature chains, if appropriate, see 7.3.4.6) of the related types. These relationship clauses are placed after any owned specializations (see 7.3.2.3) but may otherwise appear in any order with each other and with any disjoining clause (see 7.3.2.5).

```
classifier Adult;
classifier Child;

classifier Person unions Adult, Child {
    feature dependents : Child[*];
    feature offspring : Person[*];
    feature grownOffspring : Adult[*] :> offspring;
    feature dependentOffspring : Child[*] :> dependents, offspring
        differences offspring, grownOffspring
        intersects dependents, offspring;
}
```

Multiple relationships of each kind can be specified using multiple clauses in a single declaration. In the case of differencing, any additional **differences** clauses after the first one mean that the owning type does *not* classify anything classified by any of the related types. It is not allowable, though, for a type to have just one of any of these relationships over all.

```
// This is valid.
classifier Person unions Adult unions Child;

// This is NOT valid.
classifier Person unions Adult;
```

7.3.3 Classifiers

7.3.3.1 Classifiers Overview

Metamodel references:

- *Concrete syntax, 8.2.4.2*
- *Abstract syntax, 8.3.3.2*
- *Semantics, 8.4.3.3*

Classifiers are types that classify things in the modeled system, as distinct from features, which model the relations between them (see 7.3.4). *Subclassification* is a kind of specialization that specifically relates classifiers.

7.3.3.2 Classifier Declaration

The notation for a classifier is the same as the generic notation for a type (see 7.3.2.2), except using the keyword **classifier** rather than **type**. However, any general types referenced in a **specializes** list must be Classifiers, and the specializations defined are specifically *subclassifications* (see 7.3.3.3). A classifier is also not required to have any owned subclassifications explicitly specified. If no explicit subclassification is given for a classifier, and the classifier is not conjugated, then the classifier is given a default subclassification to the most general base classifier `Anything` from the `Base` library model (see 9.2.2).

```
classifier Person { // Default superclassifier is Base::Anything.
    feature age : ScalarValues::Integer;
}
classifier Child specializes Person;
```

The declaration of a classifier may also specify that the classifier is a conjugated type (see 7.3.2.4), in which case the original type must also be a classifier.

```
classifier FuelInPort {
    in feature fuelFlow : Fuel;
}
classifier FuelOutPort conjugates FuelInPort;
```

7.3.3.3 Subclassification

A subclassification relationship is declared using the keyword **specialization**, optionally followed by a short name and/or a name. The qualified name of the *subclassifier* is then given after the keyword **subclassifier**, followed by the qualified name of the *superclassifier* after the keyword **specializes**. The symbol `:>` can be used interchangeably with the keyword **specializes**. A subclassification declaration can also optionally have a relationship body (see 7.2.2.3) for, e.g., nested annotations.

```
specialization Super subclassifier A specializes B;
specialization subclassifier B :> A {
    /* This subclassification is unnamed. */
}
```

If no short name or name is given, then the keyword **specialization** may be omitted.

```
subclassifier C specializes A;
subclassifier C specializes B;
```

An owned subclassification of a Classifier is defined as part of the declaration of the Classifier, rather than in a separate declaration, by including the qualified name of the `superclassifer` in a list after the keyword **specializes** (or the symbol `:>`).

```
classifier C specializes A, B;
```

7.3.4 Features

7.3.4.1 Features Overview

Metamodel references:

- *Concrete syntax, 8.2.4.3*
- *Abstract syntax, 8.3.3.3*
- *Semantics, 8.4.3.4*

Features are types that classify how things in a modeled system are related, including by chains of relations. Relations between things can also be treated as things, allowing relations between relations, recurring as many times as needed. A feature relates instances in the intersection of the extents of its *featuring types* (the *domain*) with instances in the intersection of the extents of its *featured types* (the *co-domain*). Instances in the domain of a feature are said to "have values" that are instances of the co-domain. The domain of features with no explicit featuring types is the type `Anything` from the `Base` library model (see 9.2.2).

Type featuring is a relationship between a feature and a type that identifies the type as a featuring type of the feature. *Feature membership* is both a kind of owning membership and a kind of type featuring, by which a type owns a feature and becomes a featuring type of that feature (see 7.3.2.6).

There are also several forms of specialization that apply specifically to features.

- *Feature typing* is a relationship between a feature and a type that identifies the type as a featured type of the feature.
- *Subsetting* is a relationship between a specific feature (the *subsetting feature*) and a more general feature (the *subsetted feature*), where the specific feature may further constrain the featuring types, featured types and multiplicity of the general feature.
- *Redefinition* is a kind of subsetting in which the specific feature (the *redefining feature*) also replaces an otherwise inherited general feature (the *redefined feature*) in the context of the owning type of the specific feature.

7.3.4.2 Feature Declaration

The notation for a feature is similar to the generic notation for a type (see 7.3.2.2), except using the keyword **`feature`** rather than **`type`**. Further, a feature can have any of three kinds of specialization, each identified by a specific keyword or equivalent symbol:

- **`typed by`** or **`:`** – Specifies FeatureTyping (see 7.3.4.3).
- **`subsets`** or **`:>`** – Specifies Subsetting (see 7.3.4.4).
- **`redefines`** or **`:>>`** – Specifies Redefinition (see 7.3.4.5).

In general, clauses for the different kinds of Specialization can appear in any order in a Feature declaration.

```
feature x typed by A, B subsets f redefines g;

// Equivalent declaration:
feature x redefines g typed by A subsets f typed by B;
```

If no subsetting (or redefinition) is explicitly specified for a feature, and the feature is not conjugated, then the feature is given a default subsetting of the most general base feature `things` from the `Base` library model (see 9.2.2). This is true even if a feature typing is given for the feature.

```
abstract feature person : Person; // Default subsets Base::things.
feature child subsets person;
```

The declaration of a feature may also specify that the feature is a conjugated type (see 7.3.2.4), in which case the original type must also be a feature. In this case, the feature must not have any owned specializations.

```
classifier Tanks {
    feature fuelInPort {
        in feature fuelFlow : Fuel;
    }
    feature fuelOutPort ~ fuelInPort;
}
```

As for any type, the multiplicity of a feature can be given in square brackets `[...]` after any identification of the feature (see also 7.3.2.2). However, the multiplicity for a feature can also be placed *after* one of the specialization clauses in the feature declaration (but, in all cases, only one multiplicity may be specified). In particular, this allows a notation style for multiplicity consistent with that used in previous modeling languages (such as [UML]). It is also useful when redefining a Feature without giving an explicit name (see 7.3.4.5).

```
feature parent[2] : Person;
feature mother : Person[1] :> parent;
feature redefines children[0];
```

In addition to, or instead of, an explicit multiplicity, a feature declaration can include either or both of the following keywords (in either order). The properties flagged by these keywords are only meaningful if the feature has a multiplicity upper bound greater than one.

- **`nonunique`** – If a feature is *non-unique,* then, for any domain instance, the same co-domain instance may appear more than once as a value of the feature. The default is that the feature is *unique.*
- **`ordered`** – If a feature is *ordered,* then for any domain instance, the values of the feature can be placed in order, indexed from 1 to the number of values. The default is that the feature is *unordered.*

```
feature sensorReadings : ScalarValues::Real [*] nonunique ordered;
```

There are four other kinds of relationships that can be declared as owned relationships of a feature, each indicated by a specific keyword:

- **`disjoint from`** – Specifies disjoining (see 7.3.2.5).
- **`chains`** – Specifies feature chaining (see 7.3.4.6).
- **`inverse of`** – Specifies feature inverting (see 7.3.4.7).
- **`featured by`** – Specifies type featuring (see 7.3.4.7).

The clauses for these relationships must appear after any specialization or conjugation part, but can otherwise appear in any order.

```
feature cousins : Person[*] chains parents.siblings.children featured by Person;
feature children : Person[*] featured by Person inverse of parents;
```

There are a number of additional properties of a feature that can be flagged by adding specific keywords to its declaration. If present, these are always specified in the following order, before the keyword **`feature`**:

1. **`in`**, **`out`**, **`inout`** – Specifies the *direction* of a feature, which determines what is allowed to change its values on instances of its domain:
    - **`in`** – Things "outside" the instance. These features identify things input to an instance.
    - **`out`** – The instance itself or things "inside" it. These features identify things output by an instance.
    - **`inout`** – Both things "outside" and "inside" the instance. These features identify things that are both input to and output by an instance.
2. **`abstract`** – Specifies that the feature is *abstract* (see 7.3.2.2 on abstract types in general).
3. **`composite`** or **`portion`** – Specifies that the feature is either a *composite* or *portion* feature (specifying both is not allowed).
    - Values of composite features on each instance of their domain cannot exist after that instance does. This only applies to values at the time the instance goes out of existence, not to other things in the co-domain that might have been values before that.
    - Portion features are composite features where the values cannot exist without the whole, because they are the “same thing” as the whole. (For example, the portion of a person's life when they are a child cannot be added or removed from that person's life.)

4. **readonly** – Specifies that the feature is *read only*. Values of read only features on each instance of their domain are the same during the entire existence of that instance.
5. **derived** – Specifies that the feature is *derived*. Such a feature is typically expected to have a bound feature value expression that completely determines its value at all times (see 7.4.11 on feature values, which is a kernel concept).
6. **end** – Specifies that the feature is an *end feature*. Any kind of type can have end features, but they are mostly used in associations (see 7.4.5) and connectors (see 7.4.6), and they are further described in those contexts.

(Note that the semantics of **composite**, **portion**, and **readonly** require a model of things existing in time, which is provided in the Kernel layer, see 7.4.3).

```
classifier Fuel {
    portion feature fuelPortion : Fuel;
}

classifier Tank {
    in feature fuelFlow: Fuel;
    composite feature fuel : Fuel;
}

assoc VehicleRegistration {
    end feature owner[1] : Person;
    end feature vehicle[*] : Vehicle;
}
```

7.3.4.3 Feature Typing

A feature typing relationship is declared using the keyword **specialization**, optionally followed by a short name and/or a name. The qualified name of the typed feature is then given after the keyword **typing**, followed by the qualified name of the type, or a feature chain (see 7.3.4.6), after the keyword **typed by**. The symbol **:** can be used interchangeably with the keyword **typed by**. A feature typing declaration can also optionally have a relationship body (see 7.2.2.3) for, e.g., nested annotations.

```
specialization t1 typing customer typed by Person;
specialization t2 typing employer : Organization {
    doc /* An employer is an Organization. */
}
```

If no short name or name is given, then the keyword **specialization** may be omitted.

```
typing customer typed by Person;
typing employer : Organization;
```

An *owned feature typing* is a feature typing that is an owned relationship of its type feature. An owned feature typing is defined as part of the declaration of the typed feature, rather than in a separate declaration, by including the qualified name or feature chain for the type in a list after the keyword **typed by** (or the symbol **:**).

```
feature foodItem typed by Food, InventoryItem;
```

7.3.4.4 Subsetting

Subsetting is a kind of specialization between two features. This means that the values of the subsetting feature are also values of the subsetted feature on each instance (separately) of the domain of the subsetting feature.

A subsetting relationship is declared using the keyword **specialization**, optionally followed by a short name and/or a name. The qualified name of the subsetting feature, or a feature chain (see 7.3.4.6), is then given after the keyword **subset**, followed by the qualified name of the subsetted feature, or a feature chain, after the keyword **subsets**. The symbol :> can be used interchangeably with the keyword **subsets**. A subsetting declaration can also optionally have a relationship body (see 7.2.2.3) for, e.g., nested annotations.

```
specialization Sub subset parent subsets person;
specialization subset mother subsets parent {
    doc /* All mothers are parents. */
}
```

If no short name or name is given, then the keyword **specialization** may be omitted.

```
subset rearWheels subsets wheels;
subset rearWheels subsets driveWheels;
```

An *owned subsetting* is a subsetting that is an owned relationship of the subsetting feature. An owned subsetting is defined as part of the declaration of the subsetting feature, rather than in a separate declaration, by including the qualified name or feature chain of the subsetted feature in a list after the keyword **subsets** (or the symbol :>).

```
feature rearWheels subsets wheels, driveWheels;
```

A subsetting feature can restrict aspects of the subsetted feature, otherwise it will, by default, have the same properties as the subsetted feature. In particular, a subsetting feature can constrain its featured types to be specializations of those of the subsetted feature and add additional feature types. A subsetting feature can also restrict the multiplicity of its subsetted feature to allow cardinalities that are smaller than those of the subsetted feature (e.g., by specifying smaller lower and/or upper bounds).

```
classifier Wheel;
classifier DriveWheel specializes Wheel;
feature anyWheels[*] : Wheel;

classifier Automobile {
    // Restricts multiplicity
    composite feature wheels[4] subsets anyWheels;
    // Restricts multiplicity and type.
    composite feature driveWheels[2] : DriveWheel subsets wheels;
}
```

If a subsetted feature is ordered, then the subsetting feature must also be ordered. If the subsetted feature is unordered, then the subsetting feature will be unordered by default, unless explicitly flagged as **ordered**.

```
classifier Automobile {
    composite feature wheels[4] ordered subsets anyWheels;
    // driveWheels must be ordered because wheels is ordered.
    composite feature driveWheels[2] ordered : DriveWheel subsets wheels;
}
```

If a subsetted feature is unique, then the subsetting feature must not be specified as non-unique. If the subsetted feature is non-unique, then the subsetting feature will still be unique by default, unless specifically flagged as **nonunique**.

```
feature urls[*] nonunique : URL;
classifier Server {
    feature accessibleURLs subsets urls; // Unique by default.
    feature visibleURLs subsets accessibleURLs; // Cannot be nonunique.
}
```

7.3.4.5 Redefinition

Redefinition is a kind of subsetting that requires the values of the redefining feature and the redefined feature to be the same on each instance (separately) of the domain of the redefining feature. This means any restrictions on the values of the redefining feature relative to the redefined feature, such as typing or multiplicity, also apply to the values of the redefined feature, and vice versa.

A redefinition relationship is declared using the keyword **specialization**, optionally followed by a short name and/or a name. The qualified name of the redefining feature, or a feature chain (see 7.3.4.6), is then given after the keyword **redefinition**, followed by the qualified name of the redefined feature, or a feature chain, after the keyword **redefines**. The symbol :>> can be used interchangeably with the keyword **redefines**. A redefinition declaration can also optionally have a relationship body (see 7.2.2.3) for, e.g., nested annotations.

```
specialization Redef redefinition LegalRecord::guardian redefines parent;
specialization redefinition Vehicle::vin redefines RegisteredAsset::identifier {
    doc /* A "vin" is a Vehicle Identification Number. */
}
```

If no short name or name is given, then the keyword **specialization** may be omitted.

```
redefinition Vehicle::vin redefines RegisteredAsset::identifier;
redefinition Vehicle::vin redefines legalIdentification;
```

A feature can only be redefined once for any featuring type. A feature without any feature types is considered to be implicitly featured by the most general base type `Anything` (see 7.3.4.1). It is therefore allowable to redefine such a feature by a redefining feature that does have some other featuring type. It is, however, illegal for one such feature to redefine another, because that would correspond to a semantically inconsistent redefinition of one feature of `Anything` by another.

The restrictions on the specification of the multiplicity, ordering and uniqueness of a subsetting feature (see 7.3.4.4) also apply to a redefining feature. In addition, the multiplicity of a redefining feature must only allow cardinalities that are consistent with the multiplicity of the redefined feature (e.g., it cannot have a multiplicity lower bound that is less than that of the redefined feature).

An *owned redefinition* is a redefinition that is an owned relationship of its redefining feature. An owned redefinition of a feature is defined as part of the declaration of the feature, rather than in a separate declaration, by including the qualified name or feature chain of the redefined feature in a list after the keyword **redefines** (or the symbol :>>).

```
feature vin redefines RegisteredAsset::identifier, legalIdentification;
```

If a redefining feature is declared as an owned feature of a type (see 7.3.2.6), then each of the redefined features of its owned redefinitions must be features that would otherwise be inherited from supertypes of its owning type. When redefined, however, these otherwise inheritable features are *not* inherited and are, instead, replaced by the redefining feature. This enables the redefining feature to have the same name as a redefined feature, if desired. (Note, however, that even though a redefined feature is not in the namespace of the owning type of the redefining feature, the redefined feature still has values on instances of that type, particularly when they are considered as instances of the supertype that owns the redefined feature. The values will be the same as for the redefining feature, as described above.)

In general, the resolution of a qualified name begins with the namespace in which the name appears and proceeds outwards from there to containing namespaces (see 8.2.3.3.4). However, the resolution of the qualified names of redefined features of owned redefinitions follow special rules. In particular, the local namespace of the owning type of the redefining feature is *not* included in the name resolution of the redefined features, with resolution beginning instead with the direct supertypes of the owning type. Since redefined features are not inherited, they would not be included in the local namespace of the owning type and, therefore, could not be referenced by an unqualified name.

The special rules for redefined features, however, allow such a reference, because the name resolution begins with the namespaces of the supertypes of the owning type, one of which must contain the redefined feature.

```
classifier RegisteredAsset {
    feature identifier : Identifier;
}
classifier Vehicle : RegisteredAsset { // Owning type.
    // Legal even though "identifier" is not inherited.
    feature vin redefines identifier;
}
```

If a name is not given in the declaration of a feature with an owned redefinition, then it receives an implicit *effective name* that is the same as the name of the first redefined feature (which may itself be an implicit name, if the redefined feature is itself a redefining feature). Even though an effective name is implicit, it is the name used in name resolution, just as an explicit name would be. This is useful for constraining a redefined feature, while maintaining the same naming.

```
classifier WheeledVehicle {
    composite feature wheels[1..*] : Wheel;
}
classifier MotorizedVehicle specializes WheeledVehicle {
    composite feature redefines wheels[2..4];
}
classifier Automobile specializes MotorizedVehicle {
    composite feature redefines wheels[4] : AutomobileWheel;
}
```

7.3.4.6 Feature Chaining

Feature chaining is an owned relationship between the owning *chained feature* and a *chaining feature.* If a feature has any chaining features, then it must have at least two. The list of chaining features of a chained feature is called its *feature chain.*

The meaning of a chained feature depends on its feature chain. The values of a chained feature are the same as the values of the last feature in the chain. These can be found by starting with the values of the first feature (for each instance of the original feature's domain), then, on each of those, finding the values of the second feature in the chain, and so on, to values of the last feature.

A feature chain is notated as a sequence of two or more qualified names separated by dot (`.`) symbols. Each qualified name in a feature chain must resolve to a feature. The first qualified name in a feature chain is resolved in the local namespace as usual (see 8.2.3.3.4). Subsequent qualified names are then resolved using the previously resolved feature as the context namespace (but considering only visible memberships). This notation specifies a list of chaining features, as given by the resolution of the qualified names in the chain, in order.

The feature chain notation can be placed after the keyword **chains** in the declaration of the Feature, appearing after any specialization or conjugation part, but before any disjoining or type featuring part (see also 7.3.4.2).

```
feature cousins chains parents.siblings.children;
```

The featuring types of the chaining feature are implicitly considered to include the featuring types of the first chaining feature. Similarly, the featured types of the chaining feature are implicitly considered to include the featured types of the last chaining feature.

The feature chain notation may also be used to specify a related element in the declaration of any of the following relationships:

1. Specialization (see 7.3.2.3)
2. Disjoining (see 7.3.2.5)
3. Subsetting (see 7.3.4.4)
4. Redefinition (see 7.3.4.5)
5. Feature inverting (see 7.3.4.7)
6. Connector (see 7.4.6, in the Kernel layer)

In this case, the related element specified using the feature chain notation becomes an owned related feature of the relationship with the feature chain as notated.

```
feature uncles subsets parents.siblings;
feature cousins redefines parents.siblings.children;
connector vehicle.wheelAssembly.wheels to vehicle.road;
```

Note. A similar dot notation is also used for the related Kernel-layer concept of a feature chain expression (see 7.4.9.3). However, it is always syntactically unambiguous as to whether the notation should be parsed as a plain feature chain or as a feature chain expression.

7.3.4.7 Feature Inverting

Feature inverting is a relationship between two features twhose interpretations as relations are the inverse of each other. For example, a feature identifying each person's parents is the inverse of a feature identifying each person's children. A person identified as a parent of another will identify that other as one of their children.

A feature inverting relationship is declared using the keyword **inverting**, optionally followed by a short name and/or a name. The qualified name of the first feature, or a feature chain (see 7.3.4.6), is then given after the keyword **inverse**, followed by the qualified name of the second feature, or a feature chain, after the keyword **of**. A feature inverting declaration can also optionally have a relationship body (see 7.2.2.3) for, e.g., nested annotations.

```
inverting parent_child inverse Person::parent of Person::child {
    doc /* A Person is the parent of their children. */
}
```

If no short name or name is given, then the keyword **inverting** may be omitted.

```
inverse Person::parents of Person::children;
```

An *owned feature inverting* is a feature inverting that is an owned relationship of its first feature. An owned feature inverting is defined as part of the declaration of the inverted feature, rather than in a separate declaration, by giving the qualified name or feature chain of the other feature after the keyword **inverse of**.

```
classifier Person {
    feature children : Person[*];
    feature parents : Person[*] inverse of children;
}
```

Note that only a single feature identification is allowed after **inverse of**. While it is possible to declare multiple feature inverting relationships for a single feature, this is generally not useful.

Inverse features can be arbitrarily nested. However, while it is allowable to use feature chains in the declaration of a feature inverting relationship, note that a feature chain is a separate feature from any of the features it chains. In order to indicate that two declared features are inverses, one should use qualified names rather than feature chains.

```
classifier A {
    feature b1: B {
        feature c1: C;
```

```
    }
}
classifier C {
    feature b2: B {
        feature a2: A inverse of A::b1::c1;
    }
}
```

7.3.4.8 Type Featuring

Type featuring is a relationship between a feature and a type, identifying the type as a featuring type of the feature (see also 7.3.4.1). Feature membership is a kind of type featuring that also makes the feature an owned member of the featuring type (see 7.3.2.6).

A type featuring relationship is declared using the keyword **`featuring`**, optionally followed by a short name and/or a name, and the keyword **`of`**. The qualified name of the featured feature is then given, followed by the qualified name of the featuring type after the keyword **`featured by`**. A type featuring declaration can also optionally have a relationship body (see 7.2.2.3) for, e.g., nested annotations.

```
featuring engine_by_Vehicle of engine featured by Vehicle;
featuring power featured by engine {
    doc /* The engine of a Vehicle has power. */
}
```

An *owned type featuring* is a type featuring that is an owned relationship of the featured feature. An owned type featuring is defined as part of the declaration of the feature, rather than in a separate declaration, by including the qualified name of the featuring type in a list after the keyword **`featured by`**.

```
classifier Vehicle;
classifier PoweredComponent;
feature engine : Engine featured by Vehicle, PoweredComponent;
```

Note that the domain of a feature is given by the *intersection* of its featuring types. That is, in the above example, an instance in the domain of `engine` must be *both* a `Vehicle` *and* a `PoweredComponent`.

7.4 Kernel

7.4.1 Kernel Overview

The Kernel layer completes KerML. It extends the Core layer to add modeling capabilities beyond basic classification. These include specialized classifiers for things that have the semantics of data values (*data types*) from others that have an independent existence over time and space (*classes*), and for reified relationships between things (*associations*).

Classes have instances that exist or happen in time and space. They are divided into those for *structure* and *behavior*. Structures typically limit how things and relations between them might change over time, while behaviors specify changes within those limits. Structures and behaviors do not overlap, but structures can be involved in, perform, and own behaviors. Behaviors can coordinate other behaviors via *steps* (usages of behaviors). *Functions* are behaviors that yield a single result, which can be used to form trees of *expressions.* Interactions combine behaviors and associations. Some associations are also structures.

The Kernel layer adds semantics beyond the Core primarily by specifying how model elements use the Kernel model library (see Clause 9), rather than be specified mathematically as in the Core. In the simplest case, The Kernel textual syntax introduces keywords that translate to patterns of using Core abstract syntax and library models, acting as syntactic "markers" for modeling patterns tying Kernel to the Core. In the simplest case, this involves introducing

implicit specializations of model library types. For example, classes must directly or indirectly subclassify the library class `Object`, while behaviors must directly or indirectly sub classify the library class `Performance`. Sometimes more complicated reuse patterns are needed. For example, binary associations (with exactly two ends) specialize BinaryLink from the library, and additionally require the ends of the association to redefine the `source` and `target` ends of `BinaryLink`.

This is also how other modeling languages can be built on KerML. Domain-specific metamodels and libraries can also reuse Kernel metamodel and libraries, inheriting the patterns of library reuse above, as well as the mathematical semantics they inherit from Core. This enables domain-specific modelers to use terms and syntax familiar to them and still benefit from automated assistance based on mathematically-defined semantics.

7.4.2 Data Types

Metamodel references:

- *Concrete syntax, 8.2.5.1*
- *Abstract syntax, 8.3.4.1*
- *Semantics, 8.4.4.2*

Data types are classifiers that classify *data values* (see 9.2.2.2.2). Certain *primitive* data types have have specified extents of values, such as the numerical and other types from the `ScalarValues` library model (see 9.3.2). Other data types have features whose values can distinguish one instance of the data type from another. But, otherwise, different data values are not distinguishable.

This means that data types cannot also be classes or associations, or share instances with them. It also means that data types classify things that do not exist in time or space, because the require changing relations to other things. The feature values of a data value cannot change over time, because different feature values would inherently identify a different data value.

A data type is declared as a classifier (see 7.3.3), using the keyword **`datatype`**. If no owned superclassing is explicitly given for the data type, then it is implicitly given a default superclassing to the data type `DataValue` from the `Base` library model (see 9.2.2).

If any of the types of a feature are data types, then all of them must be. If a feature has data types as its types, and no owned subsetting or owned redefinition is explicitly given in the feature declaration, then the feature is implicitly given a default subsetting to the Feature `dataValues` from the `Base` model library (see 9.2.2).

```
datatype IdNumber specializes ScalarValues::Integer;
datatype Reading { // Subtypes Base::DataValue by default
    feature sensorId : IdNumber; // Subsets Base::dataValues by default.
    feature value : ScalarValues::Real;
}
```

7.4.3 Classes

Metamodel references:

- *Concrete syntax, 8.2.5.2*
- *Abstract syntax, 8.3.4.2*
- *Semantics, 8.4.4.3*

Classes are classifiers that classify *occurrences*, which exist in time and space (see 9.2.4). Relations between an occurrence and other things can change over time and space, while the occurrence still maintains an independent identity.

A class is declared as a classifier (see 7.3.3), using the keyword **`class`**. If no owned superclassing is explicitly given for the class, then it is implicitly given a default superclassing to the class `Occurrence` from the `Occurrences` model library (see 9.2.4).

If any of the types of a feature are classes, then all of them must be. If a feature has class types, and no owned subsetting or owned redefinition is explicitly given in the feature declaration, then the feature is implicitly given a default subsetting to the feature `occurrences` from the `Occurrences` library model (see 9.2.4), unless at least one of the types is an association structure, in which case the default subclassing is as described in 7.4.5.

```
class Situation { // Specializes Occurrences::Occurrence by default.
    feature condition : ConditionCode;
    feature soundAlarm : ScalarValues::Boolean;
}
class SituationStatusMonitor specializes StatusMonitor {
    feature currentSituation[*] : Situation; // Subsets Occurrences::occurrences by default.
}
```

7.4.4 Structures

Metamodel references:

- *Concrete syntax,* 8.2.5.3
- *Abstract syntax,* 8.3.4.3
- *Semantics,* 8.4.4.4

Structures are classes that classify o*bjects*, which are kinds of occurrences. Structures typically limit how their instances and relations between them can change over time, as opposed to Behaviors, which indicate how objects and their relations change. Structures and behaviors do not overlap, but structures can own behaviors, and the objects they classify can be involved in and perform behaviors.

A structure is declared as a classifier (see 7.3.3), using the keyword **`struct`**. If no owned superclassing is explicitly given for the structure, then it is implicitly given a default superclassing to the structure `Object` from the `Objects` library model (see 9.2.5).

If any of the types of a feature are structures, then all of them must be. If a feature has structure types, and no owned subsetting or owned redefinition is explicitly given in the feature declaration, then the feature is implicitly given a default subsetting to the feature `objects` from the `Objects` library model (see 9.2.5), unless at least one of the types is an association structure, in which case the default subsetting shall be as specified in 7.4.5.

```
struct Sensor { // Specializes Objects::Object by default.
    feature id : IdNumber;
    feature currentReading : ScalarValues::Real;
    step updateReading { ... } // Performed behavior
}
struct SensorAssembly specializes Assembly {
    composite feature sensors[*] : Sensor; // Subsets Objects::objects by default.
}
```

7.4.5 Associations

Metamodel references:

- *Concrete syntax,* 8.2.5.4
- *Abstract syntax,* 8.3.4.4
- *Semantics,* 8.4.4.5

Associations are classifiers that classify *links* between things (see 9.2.3.1) At least two owned features of an association must be end features (see 7.3.4.2), its *association ends*, which identify the things being linked by (at the "ends" of) each link (exactly one thing per end, which might be the same thing). Associations with exactly two association ends are called *binary associations*. Associations can also have features that are not end features, which characterize each instance of the association separately from the things it links.

An association is declared as a classifier (see 7.3.3), using the keyword **`assoc`**. If no owned superclassing is explicitly given for the association, then it is implicitly given a default superclassing to either the association `BinaryLink` (if it is a binary association) or the association `Link` (otherwise), both of which are from the `Links` library model (see 9.2.3).

An association is also a relationship between the types of its association ends, which might be the same type, and are identified by its *related types*. Links are between instances of an association's related types. For binary associations, the two related types are identified as the *source type* and the *target type*, which might be the same. Associations with more than two association ends ("n-ary") have only target types, no source types.

The semantics of multiplicity is different for end features from that for non-end features (as described in 7.3.4.2). The end features of an association determine the *participants* in the links that are instances of the association and, as such, effectively have multiplicity of "1" relative to the association. But, if an association end has a multiplicity specified other than `1..1,` then this is interpreted as follows: For each association end, the multiplicity, ordering and uniqueness constraints specified for that end apply to each set of instance of the association that have the same (single) values for each of the other ends. For a binary association, this corresponds to the multiplicity resulting from "navigating" across the association given a value at one end of the association to the other end of the association. (See also 8.4.4.5 on association semantics.)

If an association has a single superclass that is an association, it may inherit association ends from this superclass association. However, if it declares any owned association ends, then each of these must redefine an association end of the superclass association, in order, up to the number of association ends of the superclassifer. If no redefinition is given explicitly for an owned association end, then it is considered to implicitly redefine the association end at the same position, in order, of the superclassifer Association (including implicit defaults), if any.

```
assoc Ownership { // Specializes Links::BinaryLink by default.
    feature valuationOnPurchase : MonetaryValue;
    end feature owner[1..*] : LegalEntity; // Redefines BinaryLink::source.
    end feature ownedAsset[*] : Asset;     // Redefines BinaryLink::target.
}
assoc SoleOwnership specializes Ownership {
    end feature owner[1]; // Redefines Ownership::owner.
    // ownedAsset is inherited.
}
```

If an association has more than one superclassifer that is an association, then the association *must* declare a number of owned association ends at least equal to the maximum number of association ends of any of its superclassifier associations. Each of these owned association ends must then redefine the corresponding association end (if any) at the same position, in order, of each of the superclassifier associations.

Association structures are both associations and classes (see 7.4.3 on classes), classifying *link objects,* which are both links and objects (see 9.2.5.1 on objects). As objects, link objects can be created and destroyed, and their non-end features can change over time. However, the values of the end features of a link object are fixed and cannot change over its lifetime.

An association structure is declared like a regular association, but using the keyword **`assoc struct`**. An association structure must directly or indirectly specialize the base associations structure `LinkObject`. If this is not the case due to the explicit `ownedSuperclassifications` in its declaration, then it is implicitly given a default superclassing to either the association structure `BinaryLinkObject` (if it is a binary association structure) or the

association structure `LinkObject` (otherwise), both of which are from the `Objects` library model (see 9.2.5). The same rules on association ends described above for associations also apply to association structures. An association structure may specialize an association that is not an association structure, but all subclassifications of an association structure must be association structures.

```
// Also implicitly specializations Objects::BinaryLinkObject.
assoc struct ExtendedOwnership specializes Ownership {
    // End features are inherited from Ownership.
    // The values of the feature "revaluations" may change over time.
    feature revaluations[*] ordered : MonetaryValue;
}
```

If a feature has one or more associations as types, then these associations must all have the same number of association ends. If the feature defines owned end features in its body, then it can have no more than the number of association ends of its association types. The owned end features of such a feature follow the same rules for redefinition of the association ends of its association types as described above for the redefinition of the association ends of superclassifer associations by a subclassifier association.

If a feature declaration has no explicit owned subsettings or owned redefinitions, and any of its types are binary associations, then the feature is implicitly given a default subsetting to the feature `binaryLinks` from the `Links` library model (see 9.2.3) or to the feature `binaryLinkObjects` from the `Objects` library model (see 9.2.5), if any of the associations are association structures. If some of the types are associations, but not binary associations, then it is given a default subsetting to the feature `links` from the `Links` library model (see 9.2.3) or to the Feature `linkObjects` from the `Objects` library model (see 9.2.5), if any of the associations are association structures.

7.4.6 Connectors

7.4.6.1 Connectors Overview

Metamodel references:

- *Concrete syntax,* 8.2.5.5
- *Abstract syntax,* 8.3.4.5
- *Semantics,* 8.4.4.6

Connectors are features that are typed by associations (see 7.4.5), having values that are links (see 9.2.3.1). Like an association, a connector has end features, known as its *connector ends.* Each connector end redefines an association end from each of the associations that type the connector and subsets a feature that becomes a *related feature* of the connector. Connectors typed by binary associations are called *binary connectors.*

A connector is also a relationship between its related features. For binary connectors, the two related features are identified as the *source feature* and the *target feature,* which might be the same. Connectors with more than two connector ends ("n-ary") have only target features, no source features.

Connectors can be thought of as "instance-specific" associations, because their values (which are links) are each limited to linking things identified via related features on the same instance of the connector's domain (or by things identified by that instance, recursively, see below). For example, an association could be used to model an engine driving wheels, and to type a connector in the car model. This connector specifies an engine driving wheels only in the same car, not in another car, as would be allowed with just the association.

Specifically, the values (links) of a connector are restricted to those that link things

1. classified by the types of its association ends, regardless of the domain of the connector

2. identified by its related features for the same instance of the domain of the connector (or by things identified by that instance, recursively).

For example, if the wheels in a car are taken to be part of its drive train, rather than part of the car directly, then the engine in each car will drive wheels identified by that car's drive train, rather than a feature of the car directly. This requires that each related feature of a connector have some featuring type of the connector as a direct or indirect featuring type (where a feature with no featuring type is treated as if the classifier `Anything` was its featuring type). This condition is satisfied if a connector has an owned type for which its related features are either direct of features reached by chaining. Otherwise, explicit owned type featurings (see 7.3.4.8) should be used to ensure that the connector has a sufficiently general domain.

Binding connectors are binary connectors that require their source and target features to have the same values on each instance of their domain. They are typed by the library assoication `SelfLink` (which only links things in the modeled universe to themselves, see 9.2.3.1) and have end multiplicities of exactly 1. This requires a `SelfLink` to exist between each value of the source feature and exactly one value of the target feature, and vice-versa.

To be meaningful, the declared co-domains of the related features of a binding connector must at last overlap. Since the interpretations of data types are disjoint from those of classes, this means that a feature typed by data types can only be bound to another feature typed by data types. In the determination of the equivalence of such features, indistinguishable data values are considered equivalent. The binding of features typed by classes to another feature typed by classes, on the other hand indicates that the same occurrences play the roles represented by each of the related features.

Successions are binary connectors requiring their source and target features to identify *Occurrences* that are ordered in time. They are typed by the library association `HappensBefore` (see 9.2.4.1), which links occurrences that happen completely separately in time, with the connector's source feature being the earlier occurrence and the target feature being the later occurrence

7.4.6.2 Connector Declaration

A connector is declared as a feature (see 7.3.4.2) using the keyword **`connector`**. If no owned subsetting or owned redefinition is explicitly given, then the connector is implicitly given a default subsetting to the feature `binaryLinks` from the `Links` library model (see 9.2.3), if it is a binary connector, or to the feature `links` from the `Links` model library, if it is not a binary connector, and none of its types are association structures. If at least one of the types of a connector is an association structure, then the default subsetting is `linkObjects` from the `Objects` library model (see 9.2.5) instead of `links`, and, if it is a binary connector, the default subsetting is to `binaryLinkObjects`.

In addition, a connector declaration includes *connector end* features that redefine the ends of the associations that type the connector and reference the features related by the connector (see also the description of association ends in 7.4.5). All associations typing a connector must have the same number of association ends, which are the same as the number of related features of the connector. The connector ends are declared in the same order as the corresponding association ends. The related feature referenced by a connector end is specified using the keyword **`references`** or the equivalent symbol `::>`.

```
// Specializes Objects::BinaryLinkObject by default.
assoc struct Mounting {
    end feature mountingAxle[1] : Axle;
    end feature mountedWheel[2] : Wheel;
}
struct WheelAssembly {
    composite feature axle[1] : Axle;
    composite feature wheels[2] : Wheel;

    // Subsets Objects::binaryLinkObjects by default.
```

```
    connector mount[2] : Mounting {
        end feature mountingAxle references axle;
        end feature mountedWheel references wheels;
    }
}
```

The **references** notation indicates that connector end features have *reference subsetting* relationships to the features related by the connector. Reference subsetting has the same semantics as regular subsetting (see 7.3.4.4) but is used to syntactically differentiate one of the owned subsettings of a feature. While reference subsetting is used primarily for connector ends in KerML, it can actually be specified as an owned subsetting in the declaration of any kind of feature, using the **reference** or `::>` symbol. A feature is allowed to have at most one owned subsetting that is a reference subsetting.

```
struct WheelAssembly {
    composite feature axle[1] : Axle {
        feature mountedWheels[2] : Wheel;
    }
    composite feature wheels[2] : Wheel;
    connector mount[2] : Mounting {
        end mountingAxle references axle;
        end mountedWheel references wheels subsets mountingAxle.mountedWheels;
    }
}
```

Instead of explicitly declaring connector ends in the body of the connector, they can be listed between parentheses, after the regular feature declaration part and before the body of the connector (if any). In this case, the end declarations are limited to be of the form *e* **references** *f* or *e* `::>` *f*, where *e* is the name of an association end and *f* is the qualified name of a related feature.

```
struct WheelAssembly {
    composite feature axle[1] : Axle;
    composite feature wheels[2] : Wheel;
    connector mount[2] : Mounting (
        mountingAxle ::> axle,
        mountedWheel ::> wheels
    );
}
```

The association end names can also be omitted, in which case the connector ends are matched in order to corresponding association ends.

```
struct WheelAssembly {
    composite feature axle[1] : Axle;
    composite feature wheels[2] : Wheel;

    connector mount[2] : Mounting (axle, wheels);
}
```

By default, the connector ends of a connector are declared in the same order as the association ends of the types of the connector. However, if the connector has a single type, then the related features can be given in any order, with each related feature paired with an association end of the type using a notation of the form *e* **references** *f* or *e* `::>` *f*, where *e* is the name of an association end and *f* is the qualified name of a related feature. In this case, the name of each association end must appear exactly once in the list of connector end declarations.

A special notation can be used for a binary connector, in which the source related feature is referenced after the keyword **from**, and the target related feature is referenced after the keyword **to**.

```
struct WheelAssembly {
    composite feature axle[1] : Axle;
    composite feature wheels[2] : Wheel;

    connector mount : Mounting from axle to wheels;
}
```

If a binary connector declaration includes only the related features part, then the keyword **`from`** can be omitted.

```
struct WheelAssembly {
    composite feature axle[1] : Axle;
    composite feature wheels[2] : Wheel;

    // Subsets Links::binaryLinks by default.
    connector axle to wheels;
}
```

If a binary connector has a single type, then the names of the association ends of the type can also be used in the declaration of the connector ends in the special notation for binary connectors. However, since the connector ends are always declared in order from source to target in this notation, the association end names given must match those from the type in the order they are declared for that type.

```
struct WheelAssembly {
    composite feature axle[1] : Axle;
    composite feature wheels[2] : Wheel;
    connector mount[2] : Mounting
        from mountingAxle ::> axle
          to mountedWheel ::> wheels;
}
```

In any of the above notations, a multiplicity can be specified for a connector end, after the qualified name of the related feature for that end. In this case, the given multiplicity redefines the multiplicity that would otherwise be inherited from the association end corresponding to the connector end.

```
struct WheelAssembly {
    composite feature halfAxles[2] : Axle;
    composite feature wheels[2] : Wheel;

    // Connects each one of the halfAxles to a different one of the wheels.
    connector mount : Mounting from halfAxles[1] to wheels[1];
}
```

Note that, if a connector is an owned feature of a type (as above), the context consistency condition for the related features of the connector (see 7.4.6.1) requires that these features also be directly or indirectly nested within the owning type. The feature chain dot notation (see 7.3.4.6) should be used when connecting so-called "deeply nested" features.

While the resolution of a feature chain is similar to a qualified name, the feature path contextualizes the resolution of the final feature. Thus, for example, while the qualified name *`axle::halfAxles`* statically resolves to *`Axle::halfAxles`*, in the Feature chain *`axle.halfAxles`*, *`halfAxles`* is understood to be specifically the feature as nested in *`axle`*.

```
struct Axle {
    composite feature halfAxles[2] : HalfAxle;
}
struct Wheel {
    composite feature hub : Hub[1];
```

```
    composite feature tire : Tire[1];
}
struct WheelAssembly {
    composite feature axle[1] : Axle;
    composite feature wheels[2] : Wheel;

    connector mount : Mounting from axle.halfAxles to wheels.hub;
}
```

7.4.6.3 Binding Connector Declaration

A binding connector is declared as a feature (see 7.3.4.2) using the keyword **binding**. In addition, a binding connector declaration gives, after the keyword **of**, the qualified names of the two related features that are bound by the binding connector, separated by the symbol =, after the regular feature declaration part and before the body of the binding connector (if any). If no owned subsetting or owned redefinition is explicitly given, then the binding connector is implicitly given a default subsetting to the feature `selfLinks` from the `Links` library model (see 9.2.3). Note that, due to this default subsetting, if no `type` is explicitly given for a binding connector, then it will implicitly have the `type SelfLink` (the type of `selfLinks`).

```
struct Vehicle {
    composite feature fuelTank {
        out feature fuelFlowOut : Fuel;
    }

    composite feature engine {
        in feature fuelFlowIn : Fuel;
    }

    // Subsets Links::selfLinks by default.
    binding fuelFlowBinding of fuelTank.fuelFlowOut = engine.fuelFlowIn;
}
```

If a binding connector declaration includes only the related features part, then the keyword **of** can be omitted.

```
struct Vehicle {
    composite feature fuelTank {
        out feature fuelFlowOut : Fuel;
    }

    composite feature engine {
        in feature fuelFlowIn : Fuel;
    }

    binding fuelTank.fuelFlowOut = engine.fuelFlowIn;
}
```

The connector ends of a binding connector always have multiplicity `1..1`.

(See also 7.4.11 on the use of binding connectors with feature values.)

7.4.6.4 Succession Declaration

A succession is declared as a feature (see 7.3.4.2) using the keyword **succession**. In addition, the succession declaration gives the qualified name of the source feature after the keyword **first** and the qualified name of the target feature after the keyword **then**. If no owned subsetting or owned redefinition is explicitly given, then the succession is implicitly given a default subsetting to the feature `happensBeforeLinks` from the `Occurrences`

library model (see 9.2.4). Note that, due to this default subsetting, if no `type` is explicitly given for a succession, then it will implicitly have the `type HappensBefore` (the type of `happensBeforeLinks`).

```
behavior TakePicture {
    composite step focus : Focus;
    composite step shoot : Shoot;
    succession controlFlow first focus then shoot;
}
```

If a succession declaration includes only the related features part, then the keyword **`first`** can be omitted.

```
behavior TakePicture {
    composite step focus : Focus;
    composite step shoot : Shoot;
    succession focus then shoot;
}
```

As for connector ends on regular connectors, constraining multiplicities can also be defined for the connector ends of successions.

```
behavior TakePicture {
    composite step focus[*] : Focus;
    composite step shoot[1] : Shoot;
    // A focus may be preceded by a previous focus.
    succession focus[0..1] then focus[0..1];
    // A shoot must follow a focus.
    succession focus[1] then shoot[0..1];
}
```

7.4.7 Behaviors

7.4.7.1 Behaviors Overview

Metamodel references:

- *Concrete syntax,* 8.2.5.6
- *Abstract syntax,* 8.3.4.6
- *Semantics,* 8.4.4.7

Behaviors are classes that classify *performances*, which are kinds of occurrences that can be spread out in disconnected portions of space and time (see 9.2.6). The performance of behaviors can cause effects on other things, including their existence and relations, some of which might be accepted as input to or provided as output from the behavior.

Behaviors can have *steps,* which are features typed by behaviors, allowing the containing behavior to coordinate the performance of other behaviors. Steps can be ordered in time using succession connectors (see 7.4.6.4). They can also be connected by item flows to model things flowing between the output of one step and the input of another. Steps can also nest other steps to augment or redefine steps inherited from their behavior types.

7.4.7.2 Behavior Declaration

A behavior is declared as a classifier (see 7.3.3), using the keyword **`behavior`**. If no owned superclassing is explicitly given for the behavior, then it is implicitly given a default superclassing to the behavior `Performance` from the `Performances` library model (see 9.2.6).

Features declared in the body of a behavior with a non-null direction (see 7.3.4.2) are considered to be the owned *parameters* of the behavior. Features with direction **in** are input parameters, those with direction **out** are output parameters, and those with direction **inout** are both input and output parameters.

```
// Specializes Performances::Performance by default.
behavior TakePicture {
    in scene : Scene;
    out picture : Picture;
}
```

Parameters are ordered in the lexical order they are declared in the body of a behavior. They may appear at any location within the body.

If a behavior has owned subclassifications whose superclassifiers are behaviors, then each of the owned parameters of the subclassifier behavior must, in order, redefine the parameter at the same position of each of the superclassifier behaviors. The redefining parameters shall have the same direction as the redefined parameters.

```
behavior A { in a1; out a2; }
behavior B { in b1; out b2; }
behavior C specializes A, B {
    in c1 redefines a1, b1;
    out c2 redefines a2, b2;
}
```

If there is a single superclassifier behavior, then the subclassifier behavior can declare fewer owned parameters than the superclassifier behavior, inheriting any additional parameters from the superclassifier (which are considered to be ordered after any owned parameters). If there is more than one superclassifier behavior, then every parameter from every superclassifier must be redefined by an owned parameter of the subclassifier. If every superclassifier parameter is redefined, then the subclassifier behavior may also declare additional parameters, ordered after the redefining parameters. If no redefinitions are given explicitly for a parameter, then the parameter is implicitly given owned redefinitions of superclassifier parameters sufficient to meet the previously stated requirements.

```
behavior A1 :> A { in aa; } // aa redefines A::a1, A::a2 is inherited.
behavior B1 :> B { in b1; out b2; inout b3; } // Redefinitions are implicit.
behavior C1 :> A1, B1 { in c1; out c2; inout c3; }
```

Steps (see 7.4.7.3) declared in the body of a behavior are the owned steps of the containing behavior. A behavior can also inherit or redefine non-private steps from any superclassifer Behavior.

```
behavior Focus { in scene : Scene; out image : Image; }
behavior Shoot { in image : Image; out picture : Picture; }
behavior TakePicture {
    in scene : Scene;
    out picture : Picture;
    composite step focus : Focus;
    composite step shoot : Shoot;
}
```

Though the performance of a behavior takes place over time, the order in which its steps are declared has no implication for temporal ordering of the performance of those steps. Any restriction on temporal order, or any other connections between the steps, must be modeled explicitly.

```
behavior TakePicture {
    in scene : Scene;
   out picture : Picture;

    binding focus.scene = scene;
```

```
    composite step focus : Focus;
    succession focus then shoot;
    composite flow focus.image to shoot.image;
    composite step shoot : Shoot;
    binding picture = focus.picture;
}
```

7.4.7.3 Step Declaration

A step is declared as a feature (see 7.3.4.2) using the keyword **step**. If no owned subsetting or owned redefinition is explicitly given, then the step is implicitly given a default subsetting to the feature `performances` from the `Performances` library model (see 9.2.6).

As for a behavior, directed features declared in the body of a step are considered to be *parameters* of the step (see 7.4.7.2). If a step has owned specializations (including all feature typings, subsettings, and redefinitions), whose general type is a behavior or a step. then the rules fro the redefinition of parameters of the behaviors and steps are the same as for the redefinition of the parameters of superclassifier behaviors by a subclassifier behavior (see 7.4.7.2).

```
step focus : Focus {
    // Parameters redefine parameters of Focus.
    in scene;
    out image;
}

// Parameters are inherited.
step refocus subsets focus;
```

A step can also have a body, which may have steps in it. A step can inherit or redefine steps from its behavior types or any other steps it subsets.

```
step takePictureWithAutoFocus : TakePicture {
    in feature unfocusedScene redefines scene;
    step redefines focus : AutoFocus;
    out feature focusedPicture redefines picture;
}
```

7.4.8 Functions

7.4.8.1 Functions Overview

Metamodel references:

- *Concrete syntax,* 8.2.5.7
- *Abstract syntax,* 8.3.4.7
- *Semantics,* 8.4.4.8

Functions are behaviors (see 7.4.7) with one out parameter designated as the *result parameter*. Functions classify *evaluations* (see 9.2.6.2.3), which are kinds of performances that produce *results* as values of the result parameter. Like all behaviors, functions can change things, often referred to as "side effects". A *pure* function is one that has no side effects and always produces the same results given the same input values, similarly to a function in the mathematical sense. The numerical functions in the Kernel Function Library (see 9.4), for example, are pure functions.

Expressions are steps (see 7.4.7) typed by only a single function, which means that their values are evaluations. An expression whose value is an evaluation with results is said to *evaluate to* those results. They can be steps in any

behavior, but a function, in particular, can designate one of its expression steps as the *result expression* that gives the value of its result parameter. Expressions can have their own nested parameters, to augment or redefine those of their functions, including the result parameter. They can also own other expressions and designate a result expression, similarly to a function. (See also 7.4.9 for more on expressions).

Predicates are functions whose result is a single Boolean value (that is, true or false). A predicate determines whether the values of its input parameters meet particular conditions at the time of its evaluation, resulting in true if they do, and false otherwise. Predicates classify *boolean evaluations,* which a specialized evaluations giving a Boolean result (see 9.2.6.2.1).

Boolean expressions are expressions whose function is a predicate and, so, evaluate to a Boolean result. A boolean expression might, in general, evaluate to true at some times and false at other times. An *invariant,* though, is a boolean expression that must always evaluate to either true at all times or false at all times. By default, an invariant is asserted to always evaluate to true, while a *negated invariant* is asserted to always evaluate to false.

7.4.8.2 Function Declaration

A function is declared as a behavior (see 7.4.7.2), using the keyword **`function`**. If no owned superclassing is explicitly given for a function, then it is implicitly given a default subclassification to the function `Evaluation` from the `Performances` library model (see 9.2.6). As for a behavior, any feature declared in the body of a function with an explicit direction is considered to be a parameter of the function. In addition, the result parameter of a function may be declared in its body by beginning the declaration with the keyword **`return`** (instead of a direction keyword).

```
// Specializes Performances::Evaluation by default.
function Velocity {
    in v_i : VelocityValue;
    in a : AccelerationValue;
    in dt : TimeValue;
    return v_f : VelocityValue;
}
```

If a function has owned subclassifications that are behaviors, then the rules for redefinition or inheritance of non-result parameters are the same as for a behavior (see 7.4.7.2). If some of the superclassifier behaviors are functions, then the result parameter of the subclassifier function must redefine the result parameters of the superclassifier functions. If, in this case, the result parameter of the subclassifier function has no owned redefinitions, then it is implicitly given redefinitions of the result parameter of each of the superclassifier functions.

```
abstract function Dynamics {
    in initialState : DynamicState;
    in time : TimeValue;
    return : DynamicState;
}
function VehicleDynamics specializes Dynamics {
    // Each parameter redefines the corresponding superclassifier parameter
    in initialState : VehicleState;
    in time : TimeValue;
    return : VehicleState;
}
```

The body of a function is like the body of a behavior (see 7.4.7.2), with the optional addition of the declaration of a result expression at the end. A result expression is always be written using the Expression notation described in 7.4.9, *not* using the Expression declaration notation from 7.4.8.3. The result of the result expression is implicitly bound to the result parameter of the containing function.

```
function Average {
    in scores[1..*] : Rational;
    return : Rational;

    sum(scores) / size(scores)
}
```

Note. A result expression is written *without* a final semicolon.

The result of a function can also be explicitly bound, either using a binding connector (see 7.4.6.3) or a feature value on the result parameter declaration (see 7.4.11). In this case, the body of the function should *not* include a result expression.

```
function Average {
    in scores[1..*] : Rational;
    return : Rational = sum(scores) / size(scores);
}
```

7.4.8.3 Expression Declaration

An expression can be declared as a step (see 7.4.7.3) using the keyword **`expr`** (see also 7.4.9 for more traditional expression notation). If no owned subsetting or owned redefinition is explicitly given, then the expression is implicitly given a default subsetting to the feature `evaluations` from the `Performances` library model (see 9.2.6).

As for a step, directed features declared in the body of an expression are considered to be parameters of the expression (see 7.4.7.3). If an expression has owned specializations (including all feature typings, subsettings, and redefinitions) whose general type is a behavior (including a function) or a step (including an expression), then the rules for the redefinition of the parameters of those behaviors and steps are the same as for the redefinition of the parameters of superclassifier behaviors by a subclassifier function (see 7.4.8.2).

```
expr computation : ComputeDynamics {
    // Parameters redefined parameters of ComputeDynamics.
    in state;
    in dt;
    return result;
}
expr vehicleComputation subsets computation {
    // Input parameters are inherited, result is redefined.
    return : VehicleState;
}
```

Like a function body, an expression body can also specify a result expression.

```
expr : VehicleDynamics {
    in initialState;
    in time;
    return result;

    vehicleComputation(initialState, time)
}
```

Or the result can be explicitly bound.

```
expr : Dynamics {
    in initialState;
    in time;
```

```
    return result : VehicleState =
        vehicleComputation(initialState, time);
}
```

7.4.8.4 Predicate Declaration

A predicate is declared as a function (see 7.4.8), using the keyword **`predicate`**. If no owned subclassification is explicitly given for a predicate, then it is implicitly given a default subclassification to the predicate `BooleanEvaluation` from the `Performances` library model (see 9.2.6). If a predicate has owned subclassifications that are behaviors, then the rules for redefinition or inheritance of non-result parameters are the same as for a function (see 7.4.8.2). Since a predicate must always return a `Boolean` result, it is not necessary to explicitly declare a result parameter for it. However, if a result parameter is declared, then it must have type `Boolean` from the `ScalarValues` library model (see 9.3.2) and multiplicity `1..1` (see 7.4.12).

```
predicate isAssembled {
    in assembly : Assembly;
    in subassemblies[*] : Assembly;
}
```

The body of a predicate is the same as a function body (see 7.4.8). If a result expression is included, then it must have a `Boolean` result.

```
predicate isFull {
    in tank : FuelTank;
    tank.fuelLevel == tank.maxFuelLevel
}
```

7.4.8.5 Boolean Expression and Invariant Declaration

A boolean expression is declared as an expression (see 7.4.8.3), using the keyword **`bool`**. If no owned subsetting or owned redefinition is explicitly given, then the boolean expression is implicitly given a default subsetting to the feature `booleanEvaluations` from the `Performances` library model (see 9.2.6).

As for an expression, directed features declared in the body of a boolean expression are considered to be parameters of the boolean expression (see 7.4.8.3). If a boolean expression has owned specializations (including all feature typings, subsettings, and redefinitions) whose general type is a behavior or step, then the rules for the redefinition of the parameters of those behaviors and steps are the same as for a regular expression declaration (see 7.4.8.3). The requirements on and default for the result parameter of a boolean expression are the same as for a predicate (see 7.4.8.4).

```
// All input parameters are inherited.
bool assemblyChecks[*] : isAssembled;
```

Like a predicate body (see 7.4.8.4), a boolean expression body can specify a `Boolean` result expression.

```
class FuelTank {
    feature fuelLevel : Real;
    feature readonly maxFuelLevel : Real;
    bool isFull { fuelLevel == maxFuelLevel }
}
```

An invariant is declared like any other boolean expression, except using the keyword **`inv`** instead of **`bool`**, and, additionally, this keyword may be optionally followed by one of the keywords **`true`** or **`false`**, to indicate whether the invariant is asserted to be true or false (i.e., is negated). The default is **`true`**.

```
class FuelTank {
    feature fuelLevel : Real;
    feature readonly maxFuelLevel : Real;
    // The invariant is asserted true by default.
    inv { fuelLevel >= 0 & fuelLevel <= maxFuelLevel }
    // The invariant is explicitly asserted false, that is, it is negated.
    inv false { fuelLevel > maxFuelLevel }
}
```

7.4.9 Expressions

7.4.9.1 Expressions Overview

Metamodel references:

- *Concrete syntax,* 8.2.5.8
- *Abstract syntax,* 8.3.4.8
- *Semantics,* 8.4.4.9

As described in 7.4.8, expressions are steps typed by functions, and 7.4.8.3 covers the general notation for declaring an expression as a step. However, expressions are commonly organized into tree structures, with expressions as the nodes, and the input parameters of each expression bound to the result of each of its child expressions. KerML includes extensive textual notation for constructing expression trees, including traditional operator notations for functions in the Kernel Model Library (see Clause 9).

These expression notations map entirely to an abstract syntax involving just a few specialized kinds of expressions:

- The non-leaf nodes of an expression tree are *invocation expressions,* a kind of expression that specifies its input values as the results of other expressions (its *argument* expressions), one for each of the input parameters of its *invoked* function.
- The edges of the tree are binding connectors between the input parameters of an invocation expression (redefining those of its `function`) and the results of its argument expressions.
- The leaf nodes are these kinds of expressions:
    - *Feature reference expressions* evaluate to values of a referenced feature that is not part of the expression tree.
    - *Literal expressions* evaluate to the literal value of one of the primitive data types from the `ScalarValues` model library (see 9.3.2).
    - *Null expressions* evaluate to the empty set.

An expression can also be the referent of a feature reference expression in an expression tree, as above. This enables the evaluation of the referent expression to be taken as the value of the argument of an invocation, rather than passing the value of the *result* of the evaluation. As a shorthand for doing this, the concrete syntax for an expression body (as described in 7.4.8.3) can be used as a leaf node in the expression syntax tree.

A *model-level evaluable* expression is an expression that refers to metadata, which is data about model elements, rather than the things being modeled. Model-level evaluable expressions can give values to the features of a metadata (see 7.4.13) and be used as element filtering conditions in packages (see 7.4.14). The expressiveness of model-level evaluable expressions is restricted to support this:

- All null expressions, literal expressions and feature reference expressions are model-level evaluable.
- An invocation expression is model-level evaluable if and only if it meets the following conditions:

1. All its argument expressions are model-level evaluable.
2. It invokes a function that is listed as being model-level evaluable in Table 5 (in 8.2.5.8.1) or Table 7 (in 8.2.5.8.2).

7.4.9.2 Operator Expressions

Operator expression notation provides a shorthand for invocation expressions that invoke a library function represented as an *operator symbol*. (Table 5 in 8.2.5.8.1 shows the mapping from operator symbols to the functions they represent from the Kernel Model Library.) An operator expression contains subexpressions called its *operands* that generally correspond to the argument expressions of the invocation expression, except in the case of operators representing *control functions*, in which case the evaluation of certain operands is as determined by the function.

Operator expressions include the following:

- *Conditional expressions.* The *conditional test* operator **`if`** is followed by three operands, with the symbol `?` after the first operand and the keyword **`else`** after the second operand. A conditional expression evaluates to the value of its second or third operand, depending on whether the result of its first operand is true or false. Note that only one of the second or third operand is actually evaluated.

  ```
  if x >= 0? x else -x
  ```

- *Binary operator expressions.* A *binary operator* is one that has two operands. The binary operators include numerical operators (`+`, `-`, `*`, `/`, `%`, `^`, `**`), logical operators (`&`, `|`, **`xor`**), comparison operators (`==`, `!=`, `<`, `>`, `<=`, `>=`, `===`, `!==`), and the range construction operator (`..`). In general, both operands become arguments of the invocation expression, with their results being passed to the invocation of the function represented by the operator. However, the null-coalescing (`??`), conditional and (**`and`**), conditional or (**`xor`**) and implication (**`implies`**) operators all correspond to control functions in which their second operand is only evaluated depending on a certain condition of the value of their first operand (whether it is null, true, false, or true, respectively).

  ```
  x + y
  list[i] ?? default
  i > 0 and sensor[i] != null
  sensor == null or sensor.reading > 0
  ```

  The operators `==` and `!=` apply to operands that have single values, testing whether they are equal or unequal, respectively. They also evaluate to true or false, respectively, if their operands are both null (no values). The operators `===` and `!==` apply specifically to values that are *occurrences* (see 9.2.4). They test whether two occurrences are portions (in space and/or time) of the same *life* occurrence. Informally, these operators test whether or not two occurrences have the same "identity". For data values (values that are not occurrences), `===` and `!==` are the same as `==` and `!=`.

  ```
  currentPortion == tripPortion  // True for same trip portions
  currentPortion === tripPortion // True for any two portions of same trip
  ```

- *Unary operator expressions.* A *unary operator* is one that has a single operand. The result of evaluating the operand is passed to the invocation of the Function represented by the operator. The unary operators include the numerical operators `+` and `-` and the logical operator **`not`**.

  ```
  -x
  not isOutOfRange(sensor)
  not completed
  ```

- *Classification expressions.* The *classification operators* are syntactically similar to binary operators, but, instead of an expression as their second operand, they take a type name. The classification operators **`istype`** and **`hastype`** test whether all of the values of their first operand is classified by the named type (either including or not including subtypes, respectively). The `@` operator is similar to **`istype`**, but tests whether at least one of the values of its first operand is classified by the named type. Note that this means that **`istype`** and **`hastype`** evaluate to true on a **`null`** (empty list) value, while `@` evaluates to false.

```
sensors istype ThermalSensor // Are all sensors ThermalSensors?
sensors @ ThermalSensor // Is any sensor a ThermalSensor?
person hastype Administrator
```

The classification operator **as**, known as the *cast operator,* performs an **isType** test of whether each of the values of its first operand is classified by the named type, and then it selects only those values that pass the test to include in its result. The result values of such a cast expression (if any) are always guaranteed to be instances of the named type.

```
sensors as ThermalSensor
person as Administrator
```

The classification operators may also be used without a first operand, in which case the first operand is implicitly `Anything::self` (see 9.2.2.2.1). This is useful, in particular, when used as a test within an element filter condition expression (see 7.4.14).

```
istype ThermalSensor
@ThermalSensor
hastype Administrator
as Supervisor
```

- *Metaclassification expressions.* The metaclassification operators `@@` and **meta** take the qualified name of any kind of element as their first operand and a metaclass (see 7.4.13) as their second operand. They are shorthands for classification expressions with the operators `@` and **as**, respectively, and a metadata access expression (see 7.4.9.4) as their first operand. As such, `@@` tests whether any metadata associated with an element are classified by the given metaclass, while **meta** filters the metadata associated with an element and evaluates to those that are classified by the given metaclass.

  ```
  // Shorthand for designModel.metadata @ ApprovalAnnotation
  designModel @@ ApprovalAnnotation

  // Shorthand for sensors.metadata as KerML::Feature
  sensors meta KerML::Feature

  // Evaluates to the string "sensors".
  (sensors meta KerML::Feature).name
  ```

- *Extent expressions.* The *extent operator* **all** is syntactically similar to a unary operator, but, instead of an expression as its operand, it takes a type name. An extent expression evaluates to a sequence of all instances of the named type.

  ```
  all Sensor
  ```

In an operator expression containing nested operator expressions, the nested expressions are implicitly grouped according to the *precedence* of the operators involved, as given in Table 6 (in 8.2.5.8.1). Operator expressions with higher precedence operators are grouped more tightly than those with lower precedence operators. For example, the operator expression

```
-x + y * z
```

is considered equivalent to

```
( (-x) + (y * z) )
```

7.4.9.3 Primary Expressions

Primary expression notation provides additional shorthands for certain kinds of invocation expressions.For those cases in which the invoked function is represented by an operator symbol, the symbol is mapped to the appropriate library function as given in Table 7 (in 8.2.5.8.2).

Primary expressions include the following:

- *Index expression.* An index expression specifies the invocation of the indexing function `'['` from the `BaseFunctions` library model (see 9.4.2). The default behavior for this function is given by the specialization `SequenceFunctions::'['`, for which the first operand is expected to evaluate to a sequence of values, and the second operand is expected to evaluate to an index into that sequence. Default indexing is from 1 using `Natural` numbers. However, the functionality of the `BaseFunctions::'['` operator may be specialized differently for domain-specific types, as is already the case for the library `Array` data type (see 9.3.3.2.1).

  ```
  sensors[activeSensorIndex]
  ```

- *Sequence expression.* A sequence expression consists of a list of one or more expressions separated by comma (`,`) symbols, optionally terminated by a final comma, all surrounded by parentheses `(...)`. Such an expression specifies sequential invocations of the sequence concatenation function `','` from the `BaseFunctions` library model (see 9.4.2). The default behavior for this Function is given by the specialization `SequenceFunctions::','`, which concatenates the sequence of values resulting from evaluating its two arguments. With this behavior, a sequence expression concatenates, in order, the results of evaluating all the listed expressions.

  ```
  (temperatureSensor, windSensor, precipitationSensor)
  ( 1, 3, 5, 7, 11, 13, )
  ```

  A sequence expression with a single constituent expression simply evaluates to the value of the contained expression, as would be expected for a parenthesized expression. The empty sequence `()` is not actually a sequence expression, but, rather, an alternative notation for a null expression (see 7.4.9.4).

  ```
  (highValue + lowValue) / 2
  ```

  Sequences of values are *not* themselves values. Therefore, sequences are "flat", with no element of a sequence itself being a sequence. For example, `((1, 2, 3), 4)`, `(1, (2, 3), 4)` and `(1, null, (2, 3, 4))` all evaluate to the same sequence of values as `(1, 2, 3, 4)`. To model nested collection values, use the data types from the `Collections` library model (see 9.3.3).
- *Feature chain expression.* A feature chain expression consists of a primary expression and a feature qualified name or a feature chain (7.3.4.6), separated by a dot (`.`) symbol. The referenced feature is evaluated in the context of each of the result values of the primary expression, in order. The resulting feature values are then collected into a sequence in order of evaluation. The qualified name for the referent feature is resolved using the result parameter of the primary expression as the context namespace (see 8.2.3.3.4), but considering only visible memberships.

  ```
  // The primary expression is "getPlatform(id)".
  // The feature chain is "sensors.isActive".
  // Results in a sequence of Boolean values,
  // one for each platform sensor.
  getPlatform(id).sensors.isActive
  ```

  To avoid ambiguity, the primary expression of a feature chain expression cannot be itself a feature chain expression. To read a list of features sequentially, rather than in a single evaluation, delimit nested feature chain expressions using parentheses

```
// First evaluate "getPlaform(id).sensors",
// then evaluate ".isActive" on the result of that.
(getPlatform(id).sensors).isActive
```

- *Collect expression.* A collect expression consists of a primary expression and an expression body (see 7.4.9.4) separated by a dot (`.`) symbol. The expression body must have a single input parameter. The expression body is evaluated on each of the result values from the primary Eepression, in order, and each of the results are collected into a sequence in order of evaluation (that is, a collect expression is a shorthand for invoking the `ControlFunctions::collect` function).

  ```
  sensors.{in s: Sensor; s.reading}  // results in a sequence of
                                     // readings of each of the sensors
  ```

- *Select expression.* A select expression consists of a primary expression and an expression body (see 7.4.9.4) separated by a dot-question-mark (`.?`) symbol. The expression body must have a single input parameter and a Boolean result. The expression body is evaluated on each of the result values from the primary expression, in order, and those for which the expression body evaluates to true are selected for inclusion in the result of the select expression (that is, a select expression is a shorthand for invoking the `ControlFunctions::select` function).

  ```
  sensors.?{in s: Sensor; s.isActive}  // results in the subsequence of
                                       // sensors that are active
  ```

- *Function operation expression.* A function operation expression is a special syntax for an invocation expression in which the first argument is given before the arrow (`->`) symbol, which is followed by the name of the function to be invoked and an argument list for any remaining arguments (see 7.4.9.4). This is useful for chaining invocations in an effective data flow.

  ```
  sensors -> selectSensorsOver(limit) -> computeCriticalValue()
  ```

  If the invoked function has exactly two input parameters, and the second input parameter is an expression, then an expression body (see 7.4.9.4) can be used as the argument for the second argument without surrounding parentheses. The argument expression body should declare parameters consistent with those on the parameter expression (if any). This is particularly useful when invoking functions from the `ControlFunctions` library model (see 9.4.17).

  ```
  sensors -> select {in s: Sensor; s::isActive}
  members -> reject {in member: Member; !member->isInGoodStanding()}
  factors -> reduce {in x: Real; in y: Real; x * y}
  ```

  If the argument expression is simply the direct invocation of another function, then the argument expression may be specified using simply the name of the invoked function.

  ```
  factors -> reduce RealFunctions::'*'
  ```

7.4.9.4 Base Expressions

Base expression notation includes representations for literal expressions, null expressions, invocation expressions, feature reference expressions (including using expression bodies as base expressions).

- *Literal expressions* are described in 7.4.9.5.
- A *null expression* is notated by the keyword **null**. A null expression always evaluates to a result of "no values", which is equivalent to the empty sequence `()`.
- An *invocation expression* can be directly represented by giving the qualified name for the function to be invoked followed by a list of argument expressions, surrounded by parentheses `()` and separated by commas. The parentheses must be included, even if the argument list is empty.

```
IntegerFunctions::'+'(i, j)
isInGoodStanding(member)
Computation()
```

If the qualified name given for an invocation expression resolves to an expression instead of a function, then the invocation expression is considered to subset the named expression, meaning that, effectively, the invocation is taken to be for the function of the named expression, as specialized by that expression.

```
function UnaryFunction {in x : Anything; return: Anything;}
function apply {
    in expr fn : UnaryFunction;
    in value : Anything;

    // Invokes UnaryFunction as specified by parameter fn.
    return : Anything = fn(value);
}
```

It is also possible to specify an expression to be invoked using a feature chain (see 7.3.4.6).

```
class Stats {
    feature vales[1..*] : Real;
    expr avg { sum(values)/size(values) }
}
feature myStats : States {
    redefines feature values = (1.0, 2.0, 3.0);
}
feature myAvg = myStats.avg();
```

- A *feature reference expression* is represented simply by the qualified name of the feature being referenced.

```
member
spacecraft::mainAssembly::sensors
sensor::isActive
```

Note that the referenced feature may be an expression. The notation for a reference to an expression is distinguished from the notation for an invocation by not having following parentheses.

```
expr addOne : UnaryFunction {
    x istype Integer? (x as Integer) + 1: 0
}
feature two = apply(addOne, 1); // "addOne" is a reference to expr addOne
```

Rather than declaring a named expression in order to pass it as an argument, an *expression body* may be used directly as a base expression. In this case, any parameters must be declared as features with direction within the expression body (see 7.4.8.3). Such *body expressions* are particularly useful when used for the second argument of a function operation expression (see 7.4.9.3).

```
feature two =
    apply({in x; x istype Integer? (x as Integer) + 1: 0}, 1);
feature incrementedValues =
    values -> collect {in x: Number; x + 1};
```

- A *metadata access expression* is represented by suffixing the qualified name of any kind of element with the notation **`.metadata`**. This is a *reflective* expression that evaluates to the sequence of metadata features associated with the named element in the model itself, as instances of their respective metaclasses (see 7.4.13 on metadata and metaclasses). In addition, the last value in the sequence is an instance of the

metaclass for the named element from the *KerML* reflective abstract syntax model (see 9.2.17), representing its instantiation as a model element.

```
metaclass SecurityAnnotation;
class SecureSystem {
    metadata SecurityAnnotation;
}

// Two values: an instance of SecurityAnnotation
// and an instance of type KerML::Class.
feature sysMetadata = SecureSystem.metadata;
```

7.4.9.5 Literal Expressions

A *literal expression* is represented by giving a lexical literal for the value of the expression.

- A *literal Boolean* is represented by either of the keywords **true** or **false**.
- A *literal string* is represented by a lexical string value surrounded by double quotes "„„" as specified in 8.2.2.5.

  ```
  "This is a string literal."
  ```

- A *literal integer* is represented by a lexical decimal value as specified in 8.2.2.4. Note that notation is only provided for non-negative integers (i.e., natural numbers). Negative integers can be represented by applying the unary negation operator - (see 7.4.9.2) to an unsigned decimal literal.

  ```
  0
  1234
  ```

- A *literal rational* is represented with a syntax constructed from lexical decimal values and exponential values (see 8.2.2.4). The full rational number notation allows for a literal with a decimal point, with or without an exponential part, as well as an exponential value without a decimal point.

  ```
  3.14
  .5
  2.5E-10
  1E+3
  ```

- A *literal infinity* is represented by the symbol *.

7.4.10 Interactions

7.4.10.1 Interactions Overview

Metamodel references:

- *Concrete syntax,* 8.2.5.9
- *Abstract syntax,* 8.3.4.9
- *Semantics,* 8.4.4.10

Interactions are behaviors that are also associations (see 7.4.7 and 7.4.5, respectively), classifying performances that are also links between occurrences (see 9.2.3 through 9.2.6). They specify how the linked participants affect each other and collaborate.

Transfers are interactions between two participants that carry items from one occurrence to another, with items optionally identified by output and input features of the the source and target occurrence, respectively (see 9.2.7).

Item flows are steps that are also binary connectors (see 7.4.7 and 7.4.6, respectively), with values that are transfers. An item flow optionally ensures that items are transferred from an output feature of the connected source feature to an input feature of the target feature. *Succession item flows* are item flows that are also successions (see 7.4.6). They identify transfers that happen after their source (that is, after the end of the occurrence where the items come from) and before their target (that is, before the start of the occurrence where the items go to).

7.4.10.2 Interaction Declaration

An interaction is declared as a behavior (see 7.4.7), using the keyword **`interaction`**. If no owned subclassification is explicitly given for the interaction, then it is implicitly given default subclassifications to *both* the behavior `Performance` from the `Performances` library model (see 9.2.6) and the association `BinaryLink` or the association `Link` from the `Links` library model (see 9.2.3), depending on whether it is a binary interaction or not.

As a kind of behavior, if the interaction has owned subclassifications whose superclasses are behaviors, then the rules related to their parameters are the same as for any subclassifier behavior (see 7.4.7). As a kind of association, the body of an interaction must declare at least two association ends. If the interaction has owned subclassifications whose superclassifiers are associations, the rules related to their association ends are the same as for any association that is a subclassifier (see 7.4.5).

```
interaction Authorization {
    end feature client[*] : Computer;
    end feature server[*] : Computer;
    composite step login;
    composite step authorize;
    composite succession login then authorize;
}
```

7.4.10.3 Item Flow Declaration

An item flow declaration is syntactically similar to a binary connector declaration (see 7.4.6), using the keyword **`flow`**, or **`succession flow`** for a succession item flow. If no owned subsetting or owned redefinition is explicitly given, then the item flow is implicitly given a default subsetting to the item flow `transfers` from the `Transfers` model library (see 9.2.7), or to the succession item flow `transfersBefore`, if a succession item flow is being declared. If an item flow has owned specializations (including all feature typings, subsettings, and redefinitions) whose general type is a behavior or a step, then the rules for the redefinition of the parameters of those behaviors and steps are the same as for the redefinition of the parameters of general behavior or step by a specializing step (see 7.4.7.3).

Unlike a regular binary connector declaration, though, an item flow declaration does not directly specify the related features for the item flow. Instead, the declaration gives the *source output feature* for the transfer after the keyword **`from`** and the *target input Feature* for the transfer after the keyword **`to`**. The related features are then determined as the owning features of the features given in the item flow declaration. It is these related features that are constrained to have a common context with the item flow (see 7.4.6), not the features actually given in the declaration.

```
struct Vehicle {
    composite feature fuelTank[1] {
        out feature fuelOut[1] : Fuel;
    }
    composite feature engine {
        in feature fuelIn[1] : Fuel;
    }
    // The item flow actually connects the fuelTank to the engine.
    // The transfer moves Fuel from fuelOut to fuelIn.
    flow fuelFlow from fuelTank::fuelOut to engine::fuelIn;
}
```

The source output and target input features of an item flow can also be specified using feature chains (see 7.3.4.6). In this case, the related features are determined as the features identified by the chains, excluding the last feature. This is particularly useful when the desired related features are inherited features.

```
struct Vehicle {
    composite feature fuelTank[1] {
        out feature fuelOut[1] : Fuel;
    }
    composite feature engine[1] {
        in feature fuelIn[1] : Fuel;
    }
}

feature vehicle : Vehicle {
    // The item flow actually connects the inherited fuelTank
    // feature to the inherited engine feature.
    flow fuelFlow from fuelTank.fuelOut to engine.fuelIn;
}
```

An item flow declaration can also include an explicit declaration of the type and/or multiplicity of the items that are flowing, after the keyword **of**. This asserts that any items transferred by the item flow have the declared type. In the absence of an item declaration, any values may flow across the item flow, consistent with the types of the source output and target input featuees.

```
flow of flowingFuel : Fuel from fuelTank.fuelOut to engine.fuelIn;
```

If no feature declaration or item declaration details are included in an item flow declaration, then the keyword **from** may also be omitted.

```
flow fuelTank.fuelOut to engine.fuelIn;
```

Item flows are also commonly used to move data from the output parameters of one step to the input parameters of another step.

```
behavior TakePicture {
    composite step focus : Focus { out image[1] : Image; }
    composite step shoot : Shoot { in image[1] : Image; }
    // The use of a succession item flow means that focus must complete before
    // the image is transferred, after which shoot can begin.
    succession flow focus.image to shoot.image;
}
```

7.4.11 Feature Values

Metamodel references:

- *Concrete syntax,* 8.2.5.10
- *Abstract syntax,* 8.3.4.10
- *Semantics,* 8.4.4.11

A *feature value* is a membership relationship (see 7.2.4) between an owning feature and a *value expression,* whose result provides the value of the feature. The value is specified as either a *bound value* or an *initial value,* and as either a *concrete value* or a *default value.* A feature can have at most one feature value.

A concrete, bound feature value is declared using the symbol = followed by a representation of the value expression using the concrete syntax described in 7.4.9. This notation is appended to the declaration of the owing feature of the feature value.

```
feature monthsInYear : Natural = 12;
struct TestRecord {
    feature scores[1..*] : Integer;
    derived feature averageScore[1] : Rational = sum(scores)/size(scores);
}
```

Features that have a feature value of this form implicitly have a nested binding connector (see 7.4.6) between the feature and the result of the value expression.

Note. The semantics of binding mean that such a feature value asserts that a feature is *equivalent* to the result of the value expression. To highlight this, a feature with such a feature value can be flagged as **`derived`** (though this is not required, nor is it required that the value of a **`derived`** feature be computed using a feature value – see also 7.3.4.2).

A concrete, initial feature value is declared as above but using the symbol `:=` instead of =.

```
feature count[1] : Natural := 0;
```

In this case, the feature also has an implicit nested step typed by a `FeatureWritePerformance` (see 9.2.8.2.8) used to initialize the feature to the result of the value expression. Unlike in the case of a bound value, an initial value may be changed using subsequent `FeatureWritePerformances`.

A default feature value is declared similarly to the above, but with the keyword **`default`** preceding the symbol = or `:=`, depending on whether it is bound or initial. However, for `a` default, bound value, the symbol = may be elided.

```
struct Vehicle {
    feature mass[1] : Real default 1500.0;
    feature engine[1] : Engine default := standardEngine;
}
struct TestWithCutoff :> TestRecord {
    feature cutoff[1] : Rational default = 0.75 * averageScore;
}
```

For a default value, no binding connector or initialization step is added to the feature declaration.

A feature value can be included with the following kinds of feature declaration:

- Feature (see 7.3.4.2)
- Step (see 7.4.7.3)
- Expression (see 7.4.8.3)
- Boolean expression and invariant (see 7.4.8.5)

```
behavior ProvidePower {
    in cmd[1] : Command;
    out wheelTorque[1] : Torque;

    composite step generate : GenerateTorque {
        in cmd = ProvidePower::cmd;
        out generatedTorque;
    }
    composite step apply : ApplyTorque {
        in generatedTorque = generate.generatedTorque;
        out appliedTorque = ProvidePower::wheelTorque;
```

```
    }
}
```

7.4.12 Multiplicities

Metamodel references:

- *Concrete syntax,* 8.2.5.11
- *Abstract syntax,* 8.3.4.11
- *Semantics,* 8.4.4.12

Multiplicity is defined in the Core layer as a feature for specifying cardinalities (number of instances) of a type by enumerating all numbers the cardinality might be (see 7.3.2.2). The Kernel layer provides a specific way to do this by specifying a *range* of cardinalities. A multiplicity range has *lower bound* and *upper bound* expressions that are evaluated to determine the lowest and highest cardinalities, with both expression evaluating to natural numbers (that is, of type `Natural` from the `ScalarValues` library model, see 9.3.2). An upper bound value of `*` (infinity) means that the cardinality includes all numbers greater than or equal to the lower bound value.

A multiplicity range is written in the form `[`*`lowerBound`*`..`*`upperBound`*`]`, where each of *`lowerBound`* and *`upperBound`* is either a literal expression or a feature reference expression represented in the notation described in 7.4.9. Literal expressions can be used to specify a multiplicity range with fixed lower and/or upper bounds. If the result of the *`lowerBound`* expression is `*`, then the meaning of the multiplicity range is not defined.

A multiplicity range can also be written without the lower bound (or `..`). In this case, the result of the single expression is used as both the lower and upper bound of the range, unless the result is the infinite value `*`, in which case the lower bound is taken to be 0.

Multiplicity ranges are can be used in the declaration of types, particularly features (see 7.3.4.2).

```
struct Automobile {
    feature n : Positive[1];
    composite feature wheels : Wheel[n]; // Equivalent to [n..n] for n < *
    feature driveWheels[2..n] subsets wheels;
}
feature autoCollection : Automobile[*]; // Equivalent to [0..*]
```

It is also possible to declared a multiplicity feature using the keyword **`multiplicity`**, optionally followed by a short name and/or name, and including either a multiplicity range or a subsetting of another multiplicity. A multiplicity declaration is a kind of feature declaration, and it can optionally include a body as in a generic feature declaration (see 7.3.4.2).

```
multiplicity zeroOrMore [0..*];
multiplicity m subsets zeroOrMore;
```

If a multiplicity feature is declared in the body of a type, then then this becomes be the multiplicity of the type. A type can have at most one multiplicity, whether this is given in the declaration or the body of the type.

```
feature driveWheels subsets wheels {
    multiplicity [2..n];
}
feature autoCollection {
    multiplicity subsets zeroOrMore;
}
```

7.4.13 Metadata

Metamodel references:

- *Concrete syntax,* 8.2.5.12
- *Abstract syntax,* 8.3.4.12
- *Semantics,* 8.4.4.13

Metadata is additional information on elements of a model that does not have any instance-level semantics (in the sense described in 7.3.1). In general, metadata is specified in annotating elements (including comments and textual representations) attached to annotated elements (see 7.2.3). A *metadata feature* is a kind of annotating element that allows for the definition of structured metadata with modeler-specified features. This may be used, for example, to add tool-specific information to a model that can be relevant to the function of various kinds of tooling that may use or process a model, or domain-specific information relevant to a certain project or organization.

A metadata feature is syntactically a feature (see 7.3.4) that is typed by a single *metaclass*, which is a kind of structure (see 7.4.4), with implicit multiplicity `1..1`. If the metaclass has no features, then the metadata feature simply acts as a user-defined syntactic tag on the annotated element. If the metaclass has features, then the metadata feature must have nested features that redefine each of the features of its type, binding them to the results of model-level evaluable expressions (see 7.4.9), which provide the values of the specified attributive metadata for the annotated element.

A metaclass is declared like a structure (see 7.4.4), but using the keyword **`metaclass`**. If no owned subclassification is explicitly given for the metaclass, then it is implicitly given a default subclassification to the metaclass `Metaobject` from the `Metaobjects` library model (see 9.2.16).

```
metaclass SecurityRelated;

metaclass ApprovalAnnotation {
    feature approved[1] : Boolean;
    feature approver[1] : String;
}
```

A metadata feature is declared using the keyword **`metadata`** (or the symbol `@`), optionally followed by a short name and/or name, followed by the keyword **`typed by`** (or the symbol `:`) and the qualified name of exactly one metaclass. If no short name or name is given, then the keyword **`typed by`** (or the symbol `:`) may also be omitted. One or more annotated elements are then identified for the metadata feature after the keyword **`about`**, indicating that the metadata feature has annotation relationships to each of the identified elements (see 7.2.3).

```
metadata securityDesignAnnotation : SecurityRelated about SecurityDesign;
```

Any owned feature of a metadata feature must be a redefinition of a feature of the typing metaclass, with a feature value binding it to the result of a model-level evaluable expressions (see 7.4.9). The owned features of a metadata feature must always have the same names as the names of the typing metaclass, so the shorthand prefix redefines notation (see 7.3.4.5) is always used.

```
metadata ApprovalAnnotation about Design {
    feature redefines approved = true;
    feature redefines approver = "John Smith";
}
```

The keywords **`feature`** and/or **`redefines`** (or the equivalent symbol `:>>`) may be omitted in the declaration of a metadata feature.

```
metadata ApprovalAnnotation about Design {
    approved = true;
    approver = "John Smith";
}
```

If the metadata feature is an owned member of a namespace (see 7.2.4), then the explicit identification of annotated elements can be omitted, in which case the annotated element is implicitly the containing namespace (see 7.2.3).

```
class Design {
    // This metadata feature is implicitly about the class Design.
    @ApprovalAnnotation {
        approved = true;
        approver = "John Smith";
    }
}
```

If a metadata feature has one or more concrete features that directly or indirectly subset `Metaobject::annotatedElement`, then, for each annotated element of the metadata feature, there must be at least one such feature for which the metaclass of the annotated element conforms to all the types of the feature (which must all be specializations of the reflective metaclass `KerML::Element`, see 9.2.17).

```
metaclass Command {
    // A metadata feature of this metaclass may annotate
    // a behavior or a step.
    subsets annotatedElement : KerML::Behavior;
    subsets annotatedElement : KerML::Step;
}

behavior Save specializes UserAction {
    @Command; // This is valid.
    redefine step doAction {
        @Command; // This is valid.
    }
}
struct Options {
    @Command; // This is INVALID.
}
```

If the metaclass of a metadata feature is a direct or indirect specialization of `Metaobjects::SemanticMetadata` (see 9.2.16.2.3), then the annotated elements must all be types and the feature `SemanticMetadata::baseType` must be bound to a value of type `KerML::Type` (see 9.2.17). Each type annotated by such semantic metadata has an implicit specialization added to a type determined from the `baseType` value as follows:

- If the annotated type is neither a classifier nor a feature, then the annotated type implicitly specializes the `baseType`.
- If the annotated type is a classifier and the `baseType` is a classifier, then annotated classifier implicitly subclassifies the `baseType`.
- If the annotated type is a classifier and the `baseType` is a feature, then the annotated classifier implicitly subclassifies each type of the `baseType`.
- If the annotated type is a feature and the `baseType` is a feature, then the annotated feature shall implicitly subset the `baseType`.
- In all other cases, no implicit specialization is added.

When evaluated in a model-level evaluable expression, the meta-cast operator **`meta`** (see 7.4.9.2) may be used to cast a feature referenced as its first operand to the actual reflective metaclass value for this feature, which may then be bound to the `baseType` feature of `SemanticMetadata`.

```
behavior UserAction;
step userActions : UserAction[*] nonunique;

metaclass Command specializes SemanticMetadata {
    // The cast operation "userAction meta KerML::Feature" has
    // type KerML::Feature, which conforms to the type Type of
    // baseType. Since userActions is a step, the expression
    // evaluates at model level to a value of type KerML::Step.
    baseType = userActions meta KerML::Feature;
}

// Save implicitly subclassifies UserAction (which is the
// type of userActions).
behavior Save {
    @Command;
}

// previousAction implicitly subsets userActions.
step previousAction[1] {
    @Command;
}
```

User-Defined Keywords

A *user-defined keyword* is a (possibly qualified) Metaclass name or short name preceded by the symbol `#`. The user-defined keyword is placed immediately before the language-defined (reserved) keyword for the declaration and specifies a metadata feature annotation of the declared element. Note that this notation can only be used for metadata features that do not have nested features. If the named metaclass is a kind of *`SemanticMetadata`*, then the implicit specialization rules given above for semantic metadata apply.

```
// It is often convenient to use a lower-case initial name or
// short name for semantic metadata intended to be used as a keyword.
metaclass <command> CommandMetadata :> SemanticMetadata {
    baseType = userActions meta KerML::Feature;
}

#command behavior Save;
#command step previousAction[1];
```

It is also possible to include more than one user defined-keyword in a declaration.

```
#SecurityRelated #command def Save;
```

7.4.14 Packages

Metamodel references:

- *Concrete syntax,* 8.2.5.13
- *Abstract syntax,* 8.3.4.13
- *Semantics,* 8.4.4.14

Packages are namespaces used to group elements, without any instance-level semantics (as opposed to types, which are namespaces with classification semantics, see 7.3.2). A package is notated like a generic namespace (see 7.2.4.2), but using the keyword **`package`** instead of **`namespace`**.

```
package AddressBooks {
    datatype Entry {
```

```
        feature name[1]: String;
        feature address[1]: String;
    }
    struct AddressBook {
        composite feature entries[*]: Entry;
    }
}
```

A package may also have one or more *filter conditions* for selecting a subset of its imported memberships. A filter condition is a Boolean-valued, model-level evaluable expression (see 7.4.9) that must evaluate to true for any imported member of the package. These are notated using the keyword **filter** followed by the filter condition expression.

```
package Annotations {
    datatype ApprovalAnnotation {
        feature approved[1] : Boolean;
        feature approver[1] : String;
        feature level[1] : Natural;
    }
    ...
}

package DesignModel {
    import Annotations::*;
    struct System {
         @ApprovalAnnotation {
            approved = true;
            approver = "John Smith";
            level = 2;
        }
    }
    ...
}

package UpperLevelApprovals {
    // This package imports all direct or indirect members
    // of the DesignModel package that have been approved
    // at a level greater than 1.
    import DesignModel::**;
    filter @Annotations::ApprovalAnnotation and
       Annotations::ApprovalAnnotation::approved and
       Annotations::ApprovalAnnotation::level > 1;
}
```

A filter condition can operate on metadata on elements (see 7.4.13), such as checking for a metadata feature of a particular type or accessing the values of the features of a metadata feature. For the purposes of filter condition expressions, every element is also considered to have an implicit metadata feature that is typed by a metaclass from the reflective library model of the KerML abstract syntax (see 9.2.17). This enables filter conditions to test for the abstract syntax metaclass of an element and to access the values of abstract syntax meta-attributes.

Note that a filter condition in a package will filter *all* imports of that Package. That is why full qualification is used for `Annotations::ApprovalAnnotation` in the example above, since imported elements of the `Annotations` package would be filtered out by the very filter condition in which the elements are intended to be used. This may be avoided by combining one or more filter conditions with a specific import, using the filtered import notation described in 7.2.4.4).

```
package UpperLevelApprovals {
    // Recursively import all annotation data types and all
```

```
    // features of those types.
    import Annotations::**;

    // The filter condition for this import applies only to
    // elements imported from the DesignModel package.
    import DesignModel::**[@ApprovalAnnotation and approved and level > 1];
}
```

The `KerML` library package contains a complete model of the KerML abstract syntax represented in KerML itself. When a filter condition is evaluated on an element, abstract syntax metadata for the element can be tested as if the element had an implicit metadata feature typed by the type from the `KerML` package corresponding to the metaclass of the element.

```
package PackageApprovals {
    import Annotations::*;
    import KerML::*;

    // This imports all structures from the DesignModel that have
    // at least one owned feature and have been marked as approved.
    import DesignModel::**[@Structure and
                           Structure::ownedFeature != null and
                           @ApprovalAnnotation and
                           ApprovalAnnotation::approved];
}
```

In general, a *library package* is a package that is expected to be commonly available and reused across many user models. A package can be explicitly identified as a library package using the keyword **`library`**. This allows tooling to identify any element contained directly in a library package as being a *library element* from that specific library package.

```
library package AddressBooks {
    ...
}
```

The *standard library packages* in the Kernel Model Libraries (see Clause 9) are further identified using the keyword **`standard`**. However, only library packages from the Kernel Model Libraries, or from other recognized standard model libraries, should be identified as standard library packages.

8 Metamodel

8.1 Metamodel Overview

This clause presents the normative specification of the *metamodel* for KerML, which includes the KerML concrete syntax, abstract syntax and semantics (though the complete semantics depends on the *model library* specified in Clause 9).

1. *Concrete syntax* specifies how the language appears to modelers. Modelers construct and review models using a textual notation that conforms to the concrete syntax specification (see 8.2).
2. *Abstract syntax* specifies linguistic terms and relations between them (as opposed to library model terms), which may be expressed in the concrete syntax (see 8.3). The abstract syntax omits aspects of the concrete syntax, such as delimiters and formatting, that are do not affect what modelers are trying to expression. A concrete syntax representation of a model can be *parsed* into an abstract syntax representation, or an abstract syntax representation can be *serialized* into the concrete syntax notation. The mapping between the concrete and abstract syntax is given as part of the *grammar* specification for the concrete syntax (see 8.2.1 on the conventions for this).
3. *Semantics* specifies the interpretation of models as representations of or specifications for modeled systems (see 8.4). The semantics for a *core* subset of the abstract syntax are specified using mathematical logic. Semantics for the rest of KerML are specified by mapping complicated abstract syntax constructs into equivalent models using the core subset, and, in particular, introducing *implicit* relationships to required elements from the KerML model library (see 8.4.1 on this approach).

As described in 6.1, KerML is divided into Root, Core and Kernel Layers, which cut across each of the above facets. The subclauses on Concrete Syntax (8.2) and Abstract Syntax (8.3) are each further subdivided into subclauses on the three layers, and then, within each layer, into subclauses following the package structure of the abstract syntax. Subclause 8.4 on Semantics only covers the Core and Kernel Layers, because Root Layer constructs do not have model-level semantics.

Throughout this clause, the names of elements from the KerML abstract syntax model appear in a "`code`" font. Further:

1. Names of metaclasses appear exactly as in the abstract syntax, including capitalization, except possibly with added pluralization. When used as English common nouns, e.g., "an `Element`", "multiple `FeatureTypings`", they refer to instances of the metaclass. E.g., "`Elements` can own other `Elements`" refers to instances of the metaclass `Element` that reside in models. This can be modified with the term "metaclass" as necessary to refer to the metaclass itself instead of its instances, e.g., "The `Element` metaclass is contained in the `Elements` package."
2. Names of properties of metaclasses, when used as English common nouns, e.g., “an `ownedRelatedElement`”, “multiple `featuringTypes`”, refer to values of the properties. This can be modified using the term "metaproperty" as necessary to refer to the metaproperty itself instead of its values, e.g., "The `ownedRelatedElement` metaproperty is contained in the Elements package."

Similar stylistic conventions apply to text about KerML models, except that an "*`italic code`*" front is used.

1. Convention 1 above applies to KerML `Types` (e.g., *`Performance`*), using "type" (or a more specialized term) instead of "metaclass" (e.g., "the *`Performance`* behavior").
2. Convention 2 above applies to KerML `Features` (e.g, *`performances`*), using "feature" (or a more specialized term) instead of "metaproperty" (e.g., "the *`performances`* step").

8.2 Concrete Syntax

8.2.1 Concrete Syntax Overview

The concrete syntax for KerML is a textual notation that can be used to express or construct an abstract syntax representation of a model. The *lexical structure* of the KerML textual notation defines how the string of characters in a text is divided into a set of *lexical elements*. Such lexical elements can be categorized as *whitespace*, *notes,* or *tokens*. Only tokens are significant for the mapping of the notation to the abstract syntax. The *syntactic structure* of the KerML textual notation defines how lexical tokens are grouped and mapped to an abstract syntax representation of a model.

Both the lexical syntactic structures are specified as *grammars* consisting of productions for lexical elements or non-terminal syntactic elements (see Table 1). The body of a production is specified using an Extended Backus Naur Form (EBNF) notation (see Table 2). The syntactic grammar includes further notations to describe how the concrete syntax maps to the abstract syntax element being synthesized (see Table 3).

Subclause 8.2.2 presents the lexical grammar for KerML. Subclauses 8.2.3, 8.2.3, and 8.2.5 then each present the portion of the syntactic grammar for KerML covering the Root, Core and Kernel Layers of KerML (see 6.1). Each of these subclauses is further divided into subclauses corresponding to each of the packages from the abstract syntax model (see 8.3).

Table 1. Grammar Production Definitions

`LEXICAL_ELEMENT = ...`	Define a production for the `LEXICAL_ELEMENT`.
`NonterminalElement : AbstractSyntaxElement = ...`	Define a production for the `NonterminalElement` that synthesizes the `AbstractSyntaxElement`. If the `NonterminalElement` has the same name as the `AbstractSyntaxElement`, then "`: AbstractSyntaxElement`" may be omitted.

Table 2. EBNF Notation Conventions

Lexical element	`LEXICAL_ELEMENT`
Terminal element	`'terminal'`
Non-terminal element	`NonterminalElement`
Sequential elements	`Element1 Element2`
Alternative elements	`Element1 | Element2`
Optional elements (zero or one)	`Element ?`
Repeated elements (zero or more)	`Element *`
Repeated elements (one or more)	`Element +`
Grouping	`( Elements ... )`

Table 3. Abstract Syntax Synthesis Notation

Property assignment	`p = Element`	Assign the result of parsing the concrete syntax `Element` to abstract syntax property `p`.

List property construction	`p += Element`	Add the result of parsing the concrete syntax `Element` to the abstract syntax list property `p`.
Boolean property assignment	`p ?= Element`	If the concrete syntax `Element` is parsed, then set the abstract Boolean property `p` to true.
Non-parsing assignment	`{ p = value }` `{ p += value }`	Assign (or add) the given `value` to the abstract syntax property `p`, without parsing any input. The `value` may be a literal or a reference to another abstract syntax property. The symbol "`this`" refers to the element being synthesized.
Name resolution	`[QualifiedName]`	Parse a `QualifiedName`, then resolve that name to an Element reference (see 8.2.3.3.4) for use as a value in an assignment as above.

8.2.2 Lexical Structure

8.2.2.1 Line Terminators and White Space

```
LINE_TERMINATOR =
    implementation defined character sequence
LINE_TEXT =
    character sequence excluding LINE_TERMINATORs
WHITE_SPACE =
    space | tab | form_feed | LINE_TERMINATOR
```

Notes.

1. Notation text is divided up into lines separated by *line terminators*. A line terminator may be a single character (such as a line feed) or a sequence of characters (such as a carriage return/line feed combination). This specification does not require any specific encoding for a line terminator, but any encoding used must be consistent throughout any specific input text.

2. Any characters in text line that are not a part of the line terminator are referred to as *line text*.

3. A *white space* character is a space, tab, form feed or line terminator. Any contiguous sequence of white space characters can be used to separate tokens that would otherwise be considered to be part of a single

token. It is otherwise ignored, with the single exception that a line terminator is used to mark the end of a single-line note (see 8.2.2.2).

8.2.2.2 Notes and Comments

```
SINGLE_LINE_NOTE =
    '//' LINE_TEXT

MULTILINE_NOTE =
    '//*' COMMENT_TEXT '*/'

REGULAR_COMMENT =
    '/*' COMMENT_TEXT '*/'

COMMENT_TEXT =
    ( COMMENT_LINE_TEXT | LINE_TERMINATOR )*

COMMENT_LINE_TEXT =
    LINE_TEXT excluding the sequence '*/'
```

8.2.2.3 Names

```
NAME =
    BASIC_NAME | UNRESTRICTED_NAME

BASIC_NAME =
    BASIC_INITIAL_CHARACTER BASIC_NAME_CHARACTER*

UNRESTRICTED_NAME =
    single_quote ( NAME_CHARACTER | ESCAPE_SEQUENCE )* single_quote
    (see Note 1)

BASIC_INITIAL_CHARACTER =
    ALPHABETIC_CHARACTER | '_'

BASIC_NAME_CHARACTER =
    BASIC_INITIAL_CHARACTER | DECIMAL_DIGIT

ALPHABETIC_CHARACTER =
    any character 'a' through 'z' or 'A' through 'Z'

DECIMAL_DIGIT =
    any character '0' through '9'

NAME_CHARACTER =
    any printable character other than backslash or single_quote

ESCAPE_SEQUENCE =
    see Note 2
```

Notes.

1. The single_quote character is `'`. The name represented by an UNRESTRICTED_NAME shall consist of the characters *within* the single quotes, with escape characters resolved as described below. The surrounding single quote characters are *not* part of the represented name.
2. An ESCAPE_SEQUENCE is a sequence of two text characters starting with a backslash that actually denotes only a single character, except for the newline escape sequence, which represents however many characters is necessary to represent an end of line in a specific implementation (see also 8.2.2.1). Table 4 shows the meaning of the allowed escape sequences. The ESCAPE_SEQUENCES in an UNRESTRICTED_NAME shall be replaced by the characters specified as their meanings in the actual represented name.

Table 4. Escape Sequences

Escape Sequence	Meaning
`\'`	Single Quote
`\"`	Double Quote
`\b`	Backspace
`\f`	Form Feed
`\t`	Tab
`\n`	Line Terminator
`\\`	Backslash

8.2.2.4 Numeric Values

```
DECIMAL_VALUE =
    DECIMAL_DIGIT+

EXPONENTIAL_VALUE =
    DECIMAL_VALUE ('e' | 'E') ('+' | '-')? DECIMAL_VALUE
```

Notes.

1. A DECIMAL_VALUE may specify a natural literal, or it may be part of the specification of a real literal (see 8.2.5.8.4). Note that a DECIMAL_VALUE does not include a sign, because negating a literal is an operator in the KerML Expression syntax.
2. An EXPONENTIAL_VALUE may be used in the specification of a real literal (see 8.2.5.8.4). Note that a decimal point and fractional part are not included in the lexical structure of an exponential value. They are handled as part of the syntax of real literals.

8.2.2.5 String Value

```
STRING_VALUE =
    '"' ( STRING_CHARACTER | ESCAPE_SEQUENCE )* '"'

STRING_CHARACTER =
    any printable character other than backslash or '"'
```

Notes.

1. ESCAPE_SEQUENCE is specified in 8.2.2.3.

8.2.2.6 Reserved Words

A *reserved keyword* is a token that has the lexical structure of a basic name but cannot actually be used as a basic name. The following keywords are so reserved in KerML.

about abstract alias all and as assign assoc behavior binding bool by chains class classifier comment composite conjugate conjugates conjugation connector datatype default derived differences disjoining disjoint doc element else end expr false feature featured featuring filter first flow for from function hastype if intersects implies import in inout interaction inv inverse inverting istype language member metaclass metadata multiplicity namespace nonunique not null of or ordered out package portion predicate private protected public readonly references redefines redefinition relationship rep return specialization specializes step struct subclassifier subset subsets subtype succession then to true type typed typing unions xor

Tooling for the KerML textual notation should generally highlight keywords relative to other text, for example by using boldface and/or distinctive coloring. However, while keywords are shown in boldface in this specification, the specification does not require any specific highlighting (or any highlighting at all), and KerML textual notation documents are expected to be interchanged as plain text (see also Clause 10 on Model Interchange).

8.2.2.7 Symbols

The *symbols* shown below are non-name tokens composed entirely of characters that are not alphanumeric. In some cases these symbols have no meaning themselves, but are used to allow unambiguous separation between other tokens that do have meaning. In other cases, they are distinguished notations in the KerML Expression sublanguage (see 8.2.5.8) that map to particular library Functions or symbolic shorthand for meaningful relationships.

```
( ) { } [ ] ; , != % & * ** + - -> .. / : ::
:> :>> < <= = := == => > >= ? ?? @ ^ | ~
```

Some symbols are made of of multiple characters that may themselves individually be valid symbol tokens. Nevertheless, a multi-symbol token is not considered a combination of the individual symbol tokens. For example, "`::`" is considered a single token, not a combination of two "`:`" tokens. Input characters shall be grouped from left to right to form the longest possible sequence of characters to be grouped into a single token. So "`a::b`" would analyzed into four tokens: "`a`", "`::`", "`:`" and "`b`" (which, as it turns out, is not a valid sequence of tokens in the KerML textual concrete syntax).

Certain keywords in the concrete syntax have an equivalent symbolic representation. For convenience, the concrete syntax grammar uses the following special lexical terminals, which match either the symbol or the corresponding keyword.

```
TYPED_BY    = ':'   | 'typed' 'by'
SPECIALIZES = ':>'  | 'specializes'
SUBSETS     = ':>'  | 'subsets'
REFERENCES  = '::>' | 'references'
REDEFINES   = ':>>' | 'redefines'
CONJUGATES  = '~'   | 'conjugates'
```

8.2.3 Root Concrete Syntax

8.2.3.1 Elements and Relationships Concrete Syntax

8.2.3.1.1 Elements

```
Element =
    ( ownedRelationship += PrefixMetadataAnnotation )*
    'element' Identification ElementBody
(See Note 1)

Identification : Element =
    ( '<' shortName = NAME '>' )? ( name = NAME )?

ElementBody : Element =
    ';' | '{' OwnedElement* '}'

OwnedElement : Element =
      ownedRelationship += OwnedRelationship
      { ownedRelationship.source = this }
    | ownedRelationship += OwnedAnnotation
```

Notes

1. `PrefixMetadataAnnotation` is defined in the Kernel layer (see 8.3.4.12).

8.2.3.1.2 Relationships

```
Relationship =
    ( ownedRelationship += PrefixMetadataAnnotation )*
    'relationship' Identification
    RelationshipRelatedElements
    RelationshipBody
(See Note 1)

OwnedRelationship : Relationship =
    ( ownedRelationship += PrefixMetadataAnnotation )*
    'relationship' Identification
    ( 'to' RelationshipTargetList )?
    RelationshipBody
(See Note 1)

RelationshipRelatedElements : Relationship =
    ( 'from' RelationshipSourceList )?
    ( 'to' RelationshipTargetList )?

RelationshipSourceList : Relationship =
    RelationshipSource ( ',' RelationshipSource )*

RelationshipSource : Relationship =
    source += [QualifiedName]

RelationshipTargetList : Relationship =
    RelationshipTarget ( ',' RelationshipTarget )*

RelationshipTarget : Relationship =
    target += [QualifiedName]

RelationshipBody : Relationship =
    ';' | '{' RelationshipOwnedElement* '}'

RelationshipOwnedElement : Relationship =
      ownedRelatedElement += OwnedRelatedElement
    | ownedRelationship += OwnedAnnotation

OwnedRelatedElement : Element =
    NonFeatureElement | FeatureElement

OwnedRelatedRelationship : Relationship =
    'relationship' Identification
    RelationshipRelatedElements
    RelationshipBody
```

Notes

1. `PrefixMetadataAnnotation` is defined in the Kernel layer (see 8.3.4.12).

8.2.3.2 Annotations Concrete Syntax

8.2.3.2.1 Annotations

```
Annotation =
    annotatedElement = [QualifiedName]

OwnedAnnotation : Annotation =
    annotatingElement = AnnotatingElement
    { ownedRelatedElement += annotatingElement }

AnnotatingElement =
      Comment
    | Documentation
    | TextualRepresentation
    | MetadataFeature
```

8.2.3.2.2 Comments and Documentation

```
Comment =
    'comment' Identification
    ( 'about' annotation += Annotation
      { ownedRelationship += annotation }
      ( ',' annotation += Annotation
        { ownedRelationship += annotation } )*
    )?
    body = REGULAR_COMMENT

Documentation =
    'doc' Identification
    body = REGULAR_COMMENT
```

Notes.

1. The text of a lexical REGULAR_COMMENT or PREFIX_COMMENT shall be processed as follows before it is included as the body of a Comment or Documentation:

    1. Remove the initial `/*` and final `*/` characters.

    2. Remove any white space immediately after the initial `/*`, up to and including the first line terminator (if any).

    3. On each subsequent line of the text:

        1. Strip initial white space other than line terminators.

        2. Then, if the first remaining character is "`*`", remove it.

        3. Then, if the first remaining character is now a space, remove it.

2. The body text of a Comment can include markup information (such as HTML), and a conforming tool may display such text as rendered according to the markup. However, marked up "rich text" for a Comment written using the KerML textual concrete syntax shall be stored in the Comment body in plain text including all mark up text, with all line terminators and white space included as entered, other than what is removed according to the rules above.

8.2.3.2.3 Textual Representation

```
TextualRepresentation =
    ( 'rep' Identification )?
    'language' language = STRING_VALUE
    body = REGULAR_COMMENT
```

Notes.

1. The lexical text of a REGULAR_COMMENT shall be processed as specified in 8.2.3.2.2 for Comments before being included as the body of a TextualRepresentation.

8.2.3.3 Namespaces Concrete Syntax

8.2.3.3.1 Namespaces

```
Namespace =
    ( ownedRelationship += PrefixMetadataMember )*
    NamespaceDeclaration NamespaceBody
(See Note 1)

NamespaceDeclaration : Namespace =
    'namespace' Identification

NamespaceBody : Namespace =
    ';' | '{' NamespaceBodyElement* '}'

NamespaceBodyElement : Namespace =
      ownedRelationship += NamespaceMember
    | ownedRelationship += AliasMember
    | ownedRelationship += Import

MemberPrefix : Membership =
    ( visibility = VisibilityIndicator )?

VisibilityIndicator : VisibilityKind =
    'public' | 'private' | 'protected'

NamespaceMember : OwningMembership =
      NonFeatureMember
    | NamespaceFeatureMember

NonFeatureMember : OwningMembership =
    MemberPrefix
    ownedRelatedElement += MemberElement

NamespaceFeatureMember : Membership =
    MemberPrefix
    ownedRelatedElement += FeatureElement

AliasMember : Membership =
    MemberPrefix
    'alias' ( '<' memberShortName = NAME '>' )?
    ( memberName = NAME )?
    'for' memberElement = [QualifiedName]
    RelationshipBody

RootNamespace : Namespace =
    NamespaceBodyElement*
```

Notes

1. `PrefixMetadataMember` is defined in the Kernel layer (see 8.3.4.12).

8.2.3.3.2 Imports

```
Import : Import =
    ( visibility = VisibilityIndicator )?
    'import' ( isImportAll ?= 'all' )?
        ( ImportedNamespace
        | ImportedFilterPackage )
    RelationshipBody

ImportedNamespace : Import =
    ( importedNamespace = [QualifiedName] '::' )?
    ( importedName = NAME | '*' )
    ( '::' isRecursive ?= '**' )?

ImportedFilterPackage : Import =
    importedNamespace = FilterPackage
    { ownedRelatedElement += importedNamespace }

FilterPackage : Package =
    ownedRelationship += FilterPackageImport
    ( ownedRelationship += FilterPackageMember )+

FilterPackageImport : Import =
    ImportedNamespace

FilterPackageMember : ElementFilterMembership =
    '[' condition = OwnedExpression ']'
    { visibility = 'private' }
```

8.2.3.3.3 Namespace Elements

```
MemberElement : Element =
    AnnotatingElement | NonFeatureElement

NonFeatureElement : Element =
      Element
    | Relationship
    | Namespace
    | Type
    | Classifier
    | DataType
    | Class
    | Structure
    | Metaclass
    | Association
    | AssociationStructure
    | Interaction
    | Behavior
    | Function
    | Predicate
    | Multiplicity
    | Package
    | LibraryPackage
    | Specialization
    | Conjugation
    | Subclassification
    | Disjoining
    | FeatureInverting
    | FeatureTyping
    | Subsetting
    | Redefinition
    | TypeFeaturing

FeatureElement : Feature =
      Feature
    | Step
    | Expression
    | BooleanExpression
    | Invariant
    | Connector
    | BindingConnector
    | Succession
    | ItemFlow
    | SuccessionItemFlow
```

8.2.3.3.4 Qualified Names and Name Resolution

```
QualifiedName =
    NAME ( '::' NAME )*
```

A qualified name is notated as a sequence of *segment names* separated by "::" punctuation. An *unqualified* name can be considered the degenerate case of a qualified name with a single segment name .A qualified name is used in the KerML textual concrete syntax to identify an Element that is being referred to in the representation of another

Element. A qualified name used in this way does not appear in the corresponding abstract syntax—instead, the abstract syntax representation contains an actual reference to the identified Element. *Name resolution* is the process of determining the Element that is identified by a qualified name.

Qualified name resolution uses Namespace memberships to map simple names to named Elements. Every Namespace other than a root Namespace is nested in a containing Namespace called its `owningNamespace`. A root Namespace has an implicit containing namespace known as its *global namespace.* The global namespace for a root Namespace includes all the visible Memberships of all other root Namespaces that are *available* to the first Namespace, which shall include at least all the KerML Model Libraries (see Clause 9). A conforming tool can provide means for making additional Namespaces available to a root Namespace, but this specification does not define any standard mechanism for doing so.

An Element is considered to be *directly contained* in a Namespace if it is an `ownedElement` of the Namespace or if it is indirectly owned by the Namespace without any other intervening Namespace (e.g., if the Element is an `ownedRelatedElement` of a Relationship that is not a Membership but is an `ownedMember` of the Namespace). A Namespace defines a mapping from names to Elements directly contained in the Namespace, know as the *local resolution* of those names.

1. For each Element that is directly contained in a Namespace, but is *not* a member of the Namespace, the `shortName` and `effectiveName` of the Element, if non-null, locally resolve to that Element.
2. For each `membership` of a Namespace, the `memberShortName` and `memberName` of the Membership, if non-null, locally resolve to the `memberElement` of the Membership.

Note. If the Namespace is well formed, then there can be at most one Element that locally resolves to any given name.

The *visible resolution* of a name restricts the `memberships` in the second step to those that are visible outside the Namespace. (Note that resolution of names in the first step above is not restricted by visibility.) The *visible* Memberships of a Namespace shall comprise the following:

- All `ownedMemberships` of the Namespace with `visibility = public`.
- All `importedMemberships` of the Namespace that are derived from Import Relationships with `visibility = public`.
- If the Namespace is a Type, then all `inheritedMemberships` of the Type with `visibility = public`.

In general, the *full resolution* of a simple name relative to a Namespace then proceeds as follows:

1. If the name locally resolves to an Element directly contained in the Namespace, then it fully resolves to that Element.
2. If there is no such Element, then:
    - If the Namespace is *not* a root Namespace, then the name resolution continues with the `owningNamespace` of the Namespace.
    - If the Namespace *is* a root Namespace, then the name resolution continues with the global namespace.

The resolution of a simple name in the global namespace proceeds as follows:

1. If there is a Membership in the global namespace that has a `shortMemberName` or `memberName` equal to the simple name, then the name resolves to the `memberElement` of that Membership.
2. If there is no such Membership, then the name has no resolution.

Note. It is possible that there will be more than one Membership that resolve a given simple name. In this case, one of these Memberships is chosen for the resolution of the name, but which one is chosen is not otherwise determined by this specification.

Implementation Note. The pilot implementation currently only resolves the `ownedMemberNames` of OwningMemberships in the global namespace. Short names and aliases are *not* resolved.

A qualified name is always used to identify an Element that is a `target` Element of some *context* Relationship. The *context* Namespace is the nearest Namespace that directly or indirectly owns that Relationship. The *local namespace* for resolving the qualified name is then determined as follows:

- If the context Relationship is *not* a Membership or an Import, then the local namespace is the context Namespace.
- If the context Relationship *is* a Membership or an Import, then
    - If the context Namespace is *not* a root Namespace, then the local namespace is the `owningNamespace` of the context Namespace.
    - If the context Namespace *is* a root Namespace, then the local namespace is the global namespace for the context Namespace.

Note. Membership and Import Relationships are treated as a special case in order to avoid possible infinite recursion in the name resolution process.

The resolution of a qualified name begins with the full resolution of its first segment name with respect to the local namespace for the qualified name. If the qualified name has only one segment name, then the qualified name resolves to the resolution of its first segment name. Otherwise, each segment name of the qualified name, other than the last, must resolve to a Namespace that is the visible resolution of the name relative to the Namespace identified by the previous segment. The qualified name then resolves to the resolution of its last segment name.

Note. In the concrete syntax grammar productions, the notation `[QualifiedName]` is used to signify that a `QualifedName` shall be parsed, then that name shall be resolved into a reference to an Element, per the rules given in this subclause, and that reference shall be inserted into the abstract syntax as specified in the production, not the `QualifiedName` itself (see 8.2.1).

8.2.4 Core Concrete Syntax

8.2.4.1 Types Concrete Syntax

8.2.4.1.1 Types

```
Type =
    TypePrefix 'type'
    TypeDeclaration TypeBody

TypePrefix : Type =
    ( isAbstract ?= 'abstract' )?
    ( ownedRelationship += PrefixMetadataMember )*

```

Notes.

1. *Operator expressions* provide a shorthand notation for InvocationExpressions that invoke a library Function represented as an *operator symbol*. Table 5 shows the mapping from operator symbols to the Functions they represent from the Kernel Model Library (see Clause 9). An operator expression contains subexpressions called its *operands* that generally correspond to the `argument` Expressions of the InvocationExpression, except in the case of operators representing *control Functions*, in which case the evaluation of certain operands is as determined by the Function (see 8.4.4.9 for details).
2. Though not directly expressed in the syntactic productions given above, in any operator expression containing nested operator expressions, the nested expressions shall be implicitly grouped according to the *precedence* of the operators involved, as given in Table 6. Operator expressions with higher precedence operators shall be grouped more tightly than those with lower precedence operators.

Table 5. Operator Mapping

Operator	Library Function	Description	Model-Level Evaluable?
`all`	`BaseFunctions::'all'`	Type extent	No
`istype`	`BaseFunctions::'istype'`	All argument values are directly or indirectly instances of a type	Yes
`hastype`	`BaseFunctions::'hastype'`	All argument values are directly instances of a type	Yes
`@`	`BaseFunctions::'@'`	Any argument value is directly or indirectly an instance of a type	Yes
`@@`	`BaseFunctions::'@@'`	Any argument value is directly or indirectly an instance of a metaclass	Yes
`as`	`BaseFunctions::as`	Select instances of type (cast)	Yes
`meta`	`BaseFunctions::meta`	Select instances of a metaclass (metacast)	Yes
`==`	`BaseFunctions::'=='`	Equality	Yes
`!=`	`BaseFunctions::'!='`	Inequality	Yes
`===`	`BaseFunctions::'==='`	Same (equality for data values, same lives for occurrences)	Yes
`!==`	`BaseFunctions::'!=='`	Not same	Yes
`xor`	`DataFunctions::'xor'`	Logical "exclusive or"	Yes
`not`	`DataFunctions::'not'`	Logical "not"	Yes

Operator	Library Function	Description	Model-Level Evaluable?
`|`	`DataFunctions::'|'`	Logical "inclusive or"	Yes
`&`	`DataFunctions::'&'`	Logical "and"	Yes
`<`	`DataFunctions::'<'`	Less than	Yes
`>`	`DataFunctions::'>'`	Greater than	Yes
`<=`	`DataFunctions::'<='`	Less than or equal to	Yes
`>=`	`DataFunctions::'>='`	Greater than or equal to	Yes
`+`	`DataFunctions::'+'`	Addition	Yes
`-`	`DataFunctions::'-'`	Subtraction	Yes
`*`	`DataFunctions::'*'`	Multiplication	Yes
`/`	`DataFunctions::'/'`	Division	Yes
`%`	`DataFunctions::'%'`	Remainder	Yes
`^ **`	`DataFunctions::'^'`	Exponentiation	Yes
`..`	`DataFunctions::'..'`	Range construction	Yes
`??`	`ControlFunctions::'??'`	Null coalescing	Yes
`if`	`ControlFunctions::'if'`	Conditional test (ternary)	Yes
`or`	`ControlFunctions::'or'`	Conditional "or"	Yes
`and`	`ControlFunctions::'and'`	Conditional "and"	Yes
`implies`	`ControlFunctions::'implies'`	Conditional "implication"	Yes

8.3 Abstract Syntax

8.3.1 Abstract Syntax Overview

The KerML abstract syntax is specified as a UML model conforming to the CMOF conformance point of the Meta Object Facility Core Specification [MOF]. As shown in Fig. 1, this model is divided into three top-level packages corresponding to the three layers of KerML (see 8.1). Each top-level package contains nested packages for the modeling areas it addresses. Further, the Core package imports the Root package and the Kernel package imports the Core package, so that the Kernel package contains (as owned or imported members) all abstract syntax elements. Fig. 2 shows the generalization hierarchy for all abstract syntax elements, other than those that represent KerML Relationships, and Fig. 3 shows a similar hierarchy for all abstract syntax elements that represent Relationships.

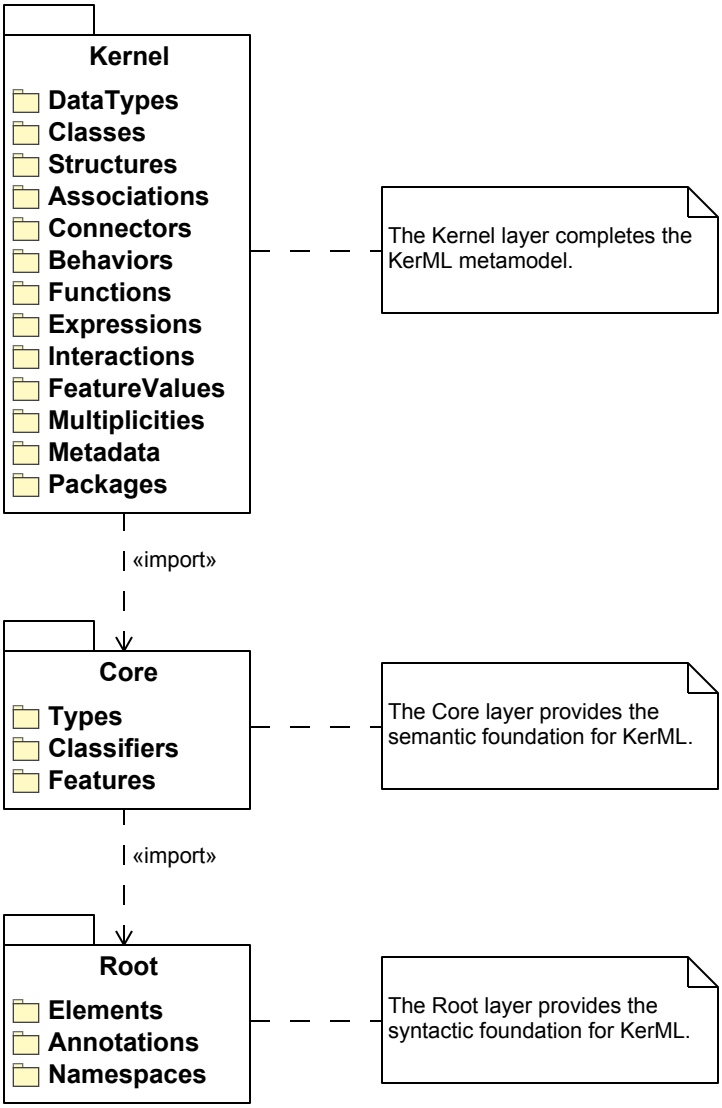

Figure 1. KerML Syntax Layers

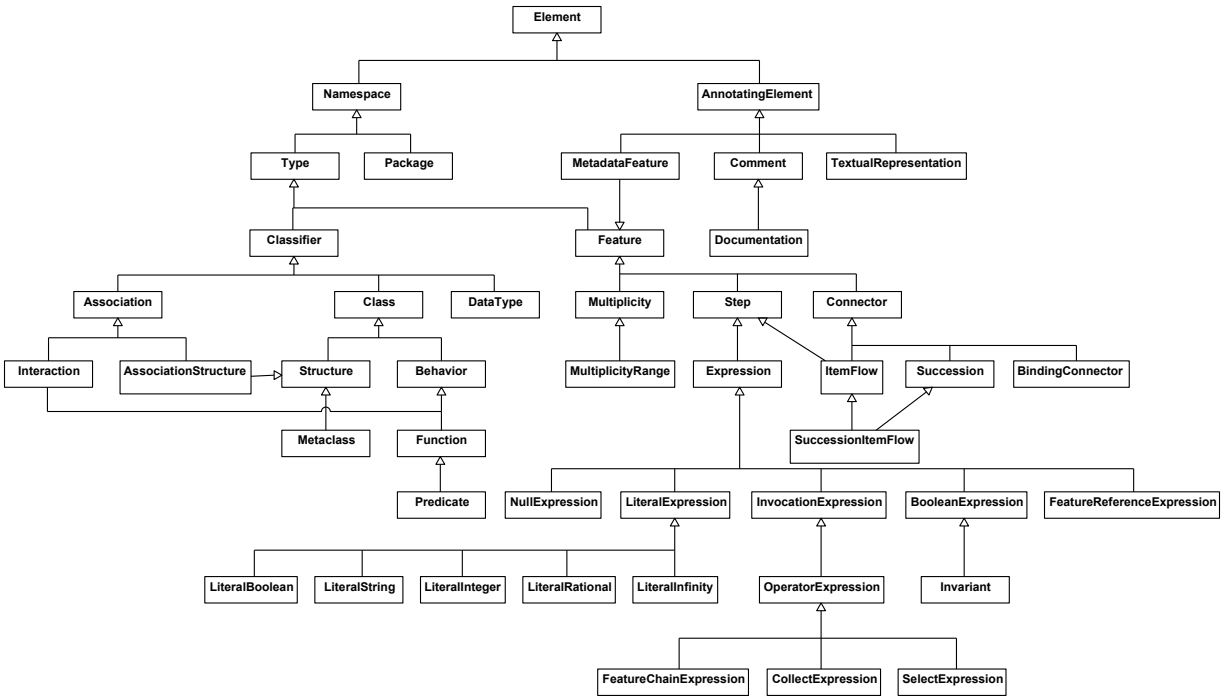

Figure 2. KerML Element Hierarchy

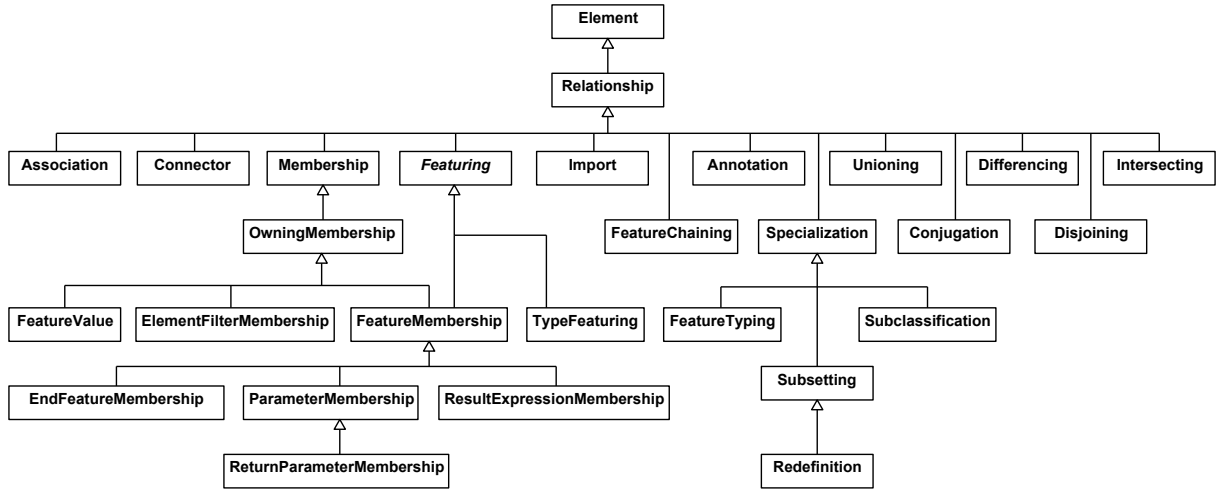

Figure 3. KerML Relationship Hierarchy

The MOF-compliant class model for the abstract syntax defines the basic structural representation for any KerML model. It is also the basis for the textual concrete syntax (see 8.2) and for other forms of serialization used for interchanging models (see Clause 10). In addition to this basic structure, the abstract syntax also includes *constraints* defined on various metaclasses. A conformant tool is shall be able to accept any KerML model that conforms to the structural abstract syntax class model, and it may then additionally report on and/or enforce the constraints on a model so represented (as further described below).

The abstract syntax model includes three kinds of constraints:

1. *Derivation constraints.* These constraints specify the how the values of the derived properties of a metaclass are computed from the values of other properties in the abstract syntax model. A tool

conformant to the KerML abstract syntax shall always enforce derivation constraints. However, the computed values of derived properties may depend on whether implied relationships are included in the model or not (see below). A derivation constraint has a name starting with the word `derive`, followed by the name of the metaclass it constrains, followed by the name of the derived property it is for. The OCL specification of such a constraint always has the form of an equality, with the derived property on the left-hand side and the derivation expression on the right-hand side. For example, the derivation constraint for the derived property `Element::ownedElement` is called `deriveElementOwnedElement` and has the OCL specification `ownedElement = ownedRelationship.ownedRelatedElement`.

2. *Semantic constraints.* These constraints specify relationships that are semantically required in a KerML model (see 8.4.2), particularly relationships with elements in the Kernel Semantic Library (see 9.2). These constraints may be violated be a model as entered by a user or as interchanged. In this case, a tool may satisfy the constraints by introducing *implicit relationships* into the model, it may simply report their violation, or it may ignore the violations. Semantic constraints have names that start with the word `check`, followed by the name of the constrained metaclass, followed by a descriptive word or phrase. For example, `checkTypeSpecialization`.
3. *Validation constraints.* These constraints specify additional syntactic conditions that must be satisfied in order to give a model a proper semantic interpretation. They are written presuming that all semantic constraints are satisfied. A *valid* model is a model that satisfies all validation constraints. A tool conformant to the KerML abstract syntax should report violations of validation constraints. A tool conformant to the KerML semantics is only required to operate on valid models. Validation constraints have names that start with the word `validate`, followed by the name of the metaclass, followed by a descriptive word or phrase. For example, `validateConnectorRelatedFeatures`.

8.3.2 Root Abstract Syntax

8.3.2.1 Elements and Relationships Abstract Syntax

8.3.2.1.1 Overview

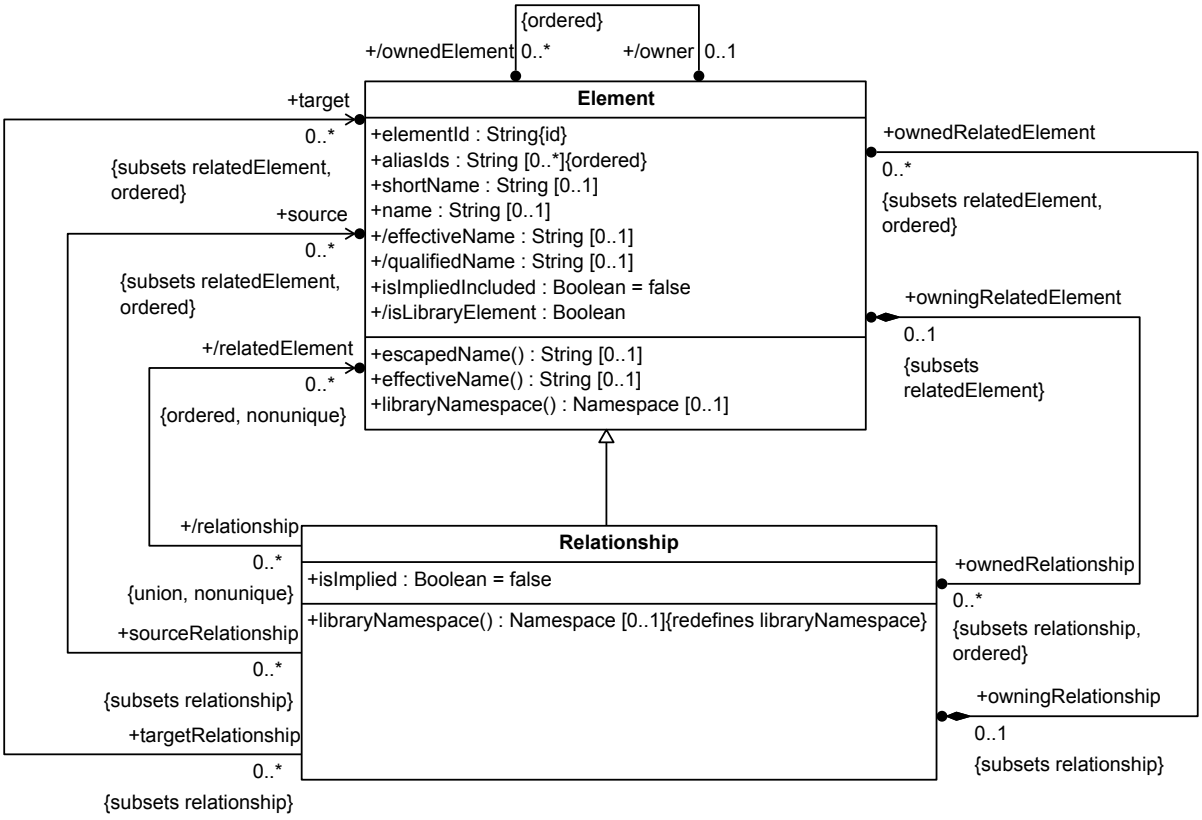

Figure 4. Elements

It is a general design principle of the KerML abstract syntax that non-Relationship Elements are related only by reified instances of Relationships. All other meta-associations between Elements are derived from these reified Relationships. For example, the `owningRelatedElement`/`ownedRelationship` meta-association between an Element and a Relationship is fundamental to establishing the structure of a model. However, the `owner`/`ownedElement` meta-association between two Elements is derived, based on the Relationship structure between them.

8.3.2.1.2 Element

Description

An Element is a constituent of a model that is uniquely identified relative to all other Elements. It can have Relationships with other Elements. Some of these Relationships might imply ownership of other Elements, which means that if an Element is deleted from a model, then so are all the Elements that it owns.

General Classes

None.

Attributes

aliasIds : String [0..*] {ordered}

Various alternative identifiers for this Element. Generally, these will be set by tools.

/documentation : Documentation [0..*] {subsets ownedElement, annotatingElement, ordered}

The Documentation owned by this Element.

/effectiveName : String [0..1]

The effective name to be used for this Element during name resolution within its `owningNamespace`.

elementId : String

The globally unique identifier for this Element. This is intended to be set by tooling, and it must not change during the lifetime of the Element.

isImpliedIncluded : Boolean

Whether all necessary implied Relationships have been included in the `ownedRelationships` of this Element. This property may be true, even if there are not actually any `ownedRelationships` with `isImplied = true`, meaning that no such Relationships are actually implied for this Element. However, if it is false, then `ownedRelationships` may *not* contain any implied Relationships. That is, either *all* required implied Relationships must be included, or none of them.

/isLibraryElement : Boolean

Whether this Element is contained in the ownership tree of a library model.

name : String [0..1]

The primary name of this Element.

/ownedAnnotation : Annotation [0..*] {subsets ownedRelationship, annotation, ordered}

The `ownedRelationships` of this Element that are Annotations, for which this Element is the `annotatedElement`.

/ownedElement : Element [0..*] {ordered}

The Elements owned by this Element, derived as the `ownedRelatedElements` of the `ownedRelationships` of this Element.

ownedRelationship : Relationship [0..*] {subsets relationship, ordered}

The Relationships for which this Element is the `owningRelatedElement`.

/owner : Element [0..1]

The owner of this Element, derived as the `owningRelatedElement` of the `owningRelationship` of this Element, if any.

/owningMembership : OwningMembership [0..1] {subsets owningRelationship, membership}

The `owningRelationship` of this Element, if that Relationship is a Membership.

/owningNamespace : Namespace [0..1] {subsets namespace}

The Namespace that owns this Element, derived as the `membershipOwningNamespace` of the `owningMembership` of this Element, if any.

owningRelationship : Relationship [0..1] {subsets relationship}

The Relationship for which this Element is an `ownedRelatedElement`, if any.

/qualifiedName : String [0..1]

The full ownership-qualified name of this Element, represented in a form that is valid according to the KerML textual concrete syntax for qualified names (including use of unrestricted name notation and escaped characters, as necessary). The `qualifiedName` is null if this Element has no `owningNamespace` or if there is not a complete ownership chain of named Namespaces from a root Namespace to this Element.

shortName : String [0..1]

An optional alternative name for the Element that is intended to be shorter or in some way more succinct than its primary `name`. It may act as a modeler-specified identifier for the Element, though it is then the responsibility of the modeler to maintain the uniqueness of this identifier within a model or relative to some other context.

/textualRepresentation : TextualRepresentation [0..*] {subsets ownedElement, annotatingElement, ordered}

The `textualRepresentations` that annotate this Element.

Operations

effectiveName() : String [0..1]

Return the effective name for this Element. By default this is the same as its `name`, but, for certain kinds of Elements, this may be overridden if the Element `name` is empty (e.g., for redefining Features).

body: `name`

escapedName() : String [0..1]

Return `effectiveName`, if that is not null, otherwise `shortName`, if that is not null, otherwise null. If the returned name is non-null, it is returned as-is if it has the form of a basic name, or, otherwise, represented as a restricted name according to the lexical structure of the KerML textual notation (i.e., surrounded by single quote characters and with special characters escaped).

libraryNamespace() : Namespace [0..1]

By default, return whether the library Namespace of the `owningRelationship` of this Element, if it has one.

body:
```
if owningRelationship <> null then owningRelationship.libraryNamespace()
else null endif
```

Constraints

deriveElementDocumentation

The `documentation` of an Element are its `ownedElements` that are Documentation.

```
documentation = ownedElement->selectByKind(Documentation)
```

deriveElementOwnedElements

The `ownedElements` of an Element are the `ownedRelatedElements` of its `ownedRelationships`.

```
ownedElement = ownedRelationship.ownedRelatedElement
```

deriveElementQualifiedName

If this Element does not have an `owningNamespace`, then its `qualifiedName` is empty. If the `owningNamespace` of this Element is a root Namespace, then the `qualifiedName` of the Element is the escaped name of the Element (if any). If the `owningNamespace` is non-empty but not a root Namespace, then the `qualifiedName` of this Element is constructed from the `qualifiedName` of the `owningNamespace` and the escaped name of the Element, unless the `qualifiedName` of the `owningNamespace` is empty, in which case the `qualifiedName` of this Element is also empty.

```
qualifiedName =
    if owningNamespace = null then null
    else if owningNamespace.owner = null then escapedName()
    else if owningNamespace.qualifiedName = null then null
    else owningNamespace.qualifiedName + '::' + escapedName()
    endif endif endif
```

deriveElementOwnedAnnotation

The `ownedAnnotations` of an Element are its `ownedRelationships` that are Annotations.

```
ownedAnnotation = ownedRelationship->selectByKind(Annotation)->
    select(a | a.annotatedElement = self)
```

deriveElementIsLibraryElement

An Element `isLibraryElement` if `libraryNamespace()` is not null.

```
isLibraryElement = libraryNamespace() <>null
```

deriveElementOwner

The `owneder` of an Element is the `owningRelatedElement` of its `owningRelationship`.

```
owner = owningRelationship.owningRelatedElement
```

deriveElementEffectiveName

The `effectiveName` of an Element is given by the result of the `effectiveName()` operation.

```
effectiveName()
```

validateElementIsImpliedIncluded

[no documentation]

```
ownedRelationship->exists(isImplied) implies isImpliedIncluded
```

8.3.2.1.3 Relationship

Description

A Relationship is an Element that relates other Elements. Some of its `relatedElements` may be owned, in which case those `ownedRelatedElements` will be deleted from a model if their `owningRelationship` is. A Relationship may also be owned by another Element, in which case the `ownedRelatedElements` of the Relationship are also considered to be transitively owned by the `owningRelatedElement` of the Relationship.

The `relatedElements` of a Relationship are divided into `source` and `target` Elements. The Relationship is considered to be directed from the `source` to the `target` Elements. An undirected Relationship may have either all `source` or all `target` Elements.

A "relationship Element" in the abstract syntax is generically any Element that is an instance of either Relationship or a direct or indirect specialization of Relationship. Any other kind of Element is a "non-relationship Element". It is a convention of that non-relationship Elements are *only* related via reified relationship Elements. Any meta-associations directly between non-relationship Elements must be derived from underlying reified Relationships.

General Classes

Element

Attributes

isImplied : Boolean

Whether this Relationship was generated by tooling to meet semantic rules, rather than being directly created by a modeler.

ownedRelatedElement : Element [0..*] {subsets relatedElement, ordered}

The `relatedElements` of this Relationship that are owned by the Relationship.

owningRelatedElement : Element [0..1] {subsets relatedElement}

The `relatedElement` of this Relationship that owns the Relationship, if any.

/relatedElement : Element [0..*] {ordered, nonunique}

The Elements that are related by this Relationship, derived as the union of the `source` and `target` Elements of the Relationship.

source : Element [0..*] {subsets relatedElement, ordered}

The `relatedElements from which this Relationship is considered to be directed.`

target : Element [0..*] {subsets relatedElement, ordered}

The `relatedElements` to which this Relationship is considered to be directed.

Operations

libraryNamespace() : Namespace [0..1]

Return whether this Relationship has either an `owningRelatedElement` or `owningRelationship` that is a library element.

```
body: if owningRelatedElement <> null then owningRelatedElement.libraryNamespace()
else if owningRelationship <> null then owningRelationship.libraryNamespace()
else null endif endif
```

Constraints

deriveRelationshipRelatedElement

The `relatedElements` of a Relationship consist of all of its `source` Elements followed by all of its `target` Elements.

```
relatedElement = source->union(target)
```

8.3.2.2 Annotations Abstract Syntax

8.3.2.2.1 Overview

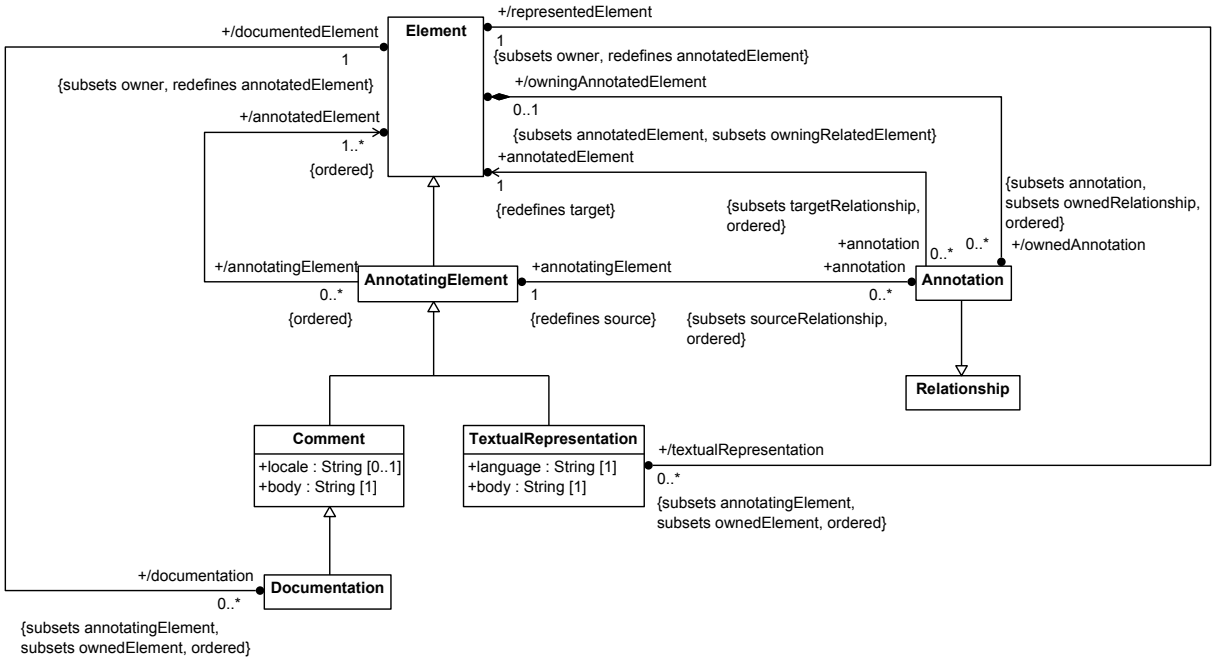

Figure 5. Annotation

8.3.2.2.2 AnnotatingElement

Description

An AnnotatingElement is an Element that provides additional description of or metadata on some other Element. An AnnotatingElement is attached to its `annotatedElement` by an Annotation Relationship.

General Classes

Element

Attributes

/annotatedElement : Element [1..*] {ordered}

The Elements that are annotated by this AnnotatingElement. If `annotation is not empty, this is derived as the annotatedElements of the annotations. If annotation, then it is derived as the owningNamespace of the AnnotatingElement.`

annotation : Annotation [0..*] {subsets sourceRelationship, ordered}

The Annotations that relate this AnnotatingElement to its `annotatedElements`.

Operations

No operations.

Constraints

deriveAnnotatingElementAnnotatedElement

[no documentation]

```
annotatedElement =
 if annotation->notEmpty() then annotation.annotatedElement
 else owningNamespace endif
```

8.3.2.2.3 Annotation

Description

An Annotation is a Relationship between an AnnotatingElement and the Element that is annotated by that AnnotatingElement.

General Classes

Relationship

Attributes

annotatedElement : Element {redefines target}

The Element that is annotated by the `annotatingElement` of this Annotation.

annotatingElement : AnnotatingElement {redefines source}

The AnnotatingElement that annotates the `annotatedElement` of this Annotation.

/owningAnnotatedElement : Element [0..1] {subsets annotatedElement, owningRelatedElement}

The `annotatedElement` of this Annotation, when it is also its `owningRelatedElement`.

Operations

No operations.

Constraints

None.

8.3.2.2.4 Comment

Description

A Comment is an AnnotatingElement whose `body` in some way describes its `annotatedElements`.

General Classes

AnnotatingElement

Attributes

body : String

The annotation text for the Comment.

locale : String [0..1]

Identification of the language of the `body` text and, optionally, the region and/or encoding. The format shall be a POSIX locale conformant to ISO/IEC 15897, with the format `[language[_territory][.codeset][@modifier]]`.

Operations

No operations.

Constraints

None.

8.3.2.2.5 Documentation

Description

Documentation is a Comment that specifically documents a `documentedElement`, which must be its `owner`.

General Classes

Comment

Attributes

/documentedElement : Element {subsets owner, redefines annotatedElement}

The Element that is documented by this Documentation.

Operations

No operations.

Constraints

None.

8.3.2.2.6 TextualRepresentation

Description

A TextualRepresentation is an AnnotatingElement whose `body` represents the `representedElement` in a given `language`. The `representedElement` must be the `owner` of the TextualRepresentation. The named `language` can be a natural language, in which case the `body` is an informal representation, or an artifical language, in which case the `body` is expected to be a formal, machine-parsable representation.

If the named `language` of a TextualRepresentation is machine-parsable, then the `body` text should be legal input text as defined for that `language`. The interpretation of the named language string shall be case insensitive. The following `language` names are defined to correspond to the given standard languages:

`kerml`	Kernel Modeling Language
`ocl`	Object Constraint Language
`alf`	Action Language for fUML

Other specifications may define specific `language` strings, other than those shown in view link does not exist , to be used to indicate the use of languages from those specifications in KerML TextualRepresentations.

If the `language` of a TextualRepresentation is "`kerml`", then the `body` text shall be a legal representation of the `representedElement` in the KerML textual concrete syntax. A conforming tool can use such a TextualRepresentation Annotation to record the original KerML concrete syntax text from which an Element was parsed. In this case, it is a tool responsibility to ensure that the `body` of the TextualRepresentation remains correct (or the Annotation is removed) if the annotated Element changes other than by re-parsing the `body` text.

An Element with a TextualRepresentation in a language other than KerML is essentially a semantically "opaque" Element specified in the other language. However, a conforming KerML tool may interpret such an element consistently with the specification of the named language.

General Classes

AnnotatingElement

Attributes

body : String

The textual representation of the `representedElement` in the given `language`.

language : String

The natural or artifical language in which the `body` text is written.

/representedElement : Element {subsets owner, redefines annotatedElement}

The Element that is represented by this TextualRepresentation.

Operations

No operations.

Constraints

None.

8.3.2.3 Namespace Abstract Syntax

8.3.2.3.1 Overview

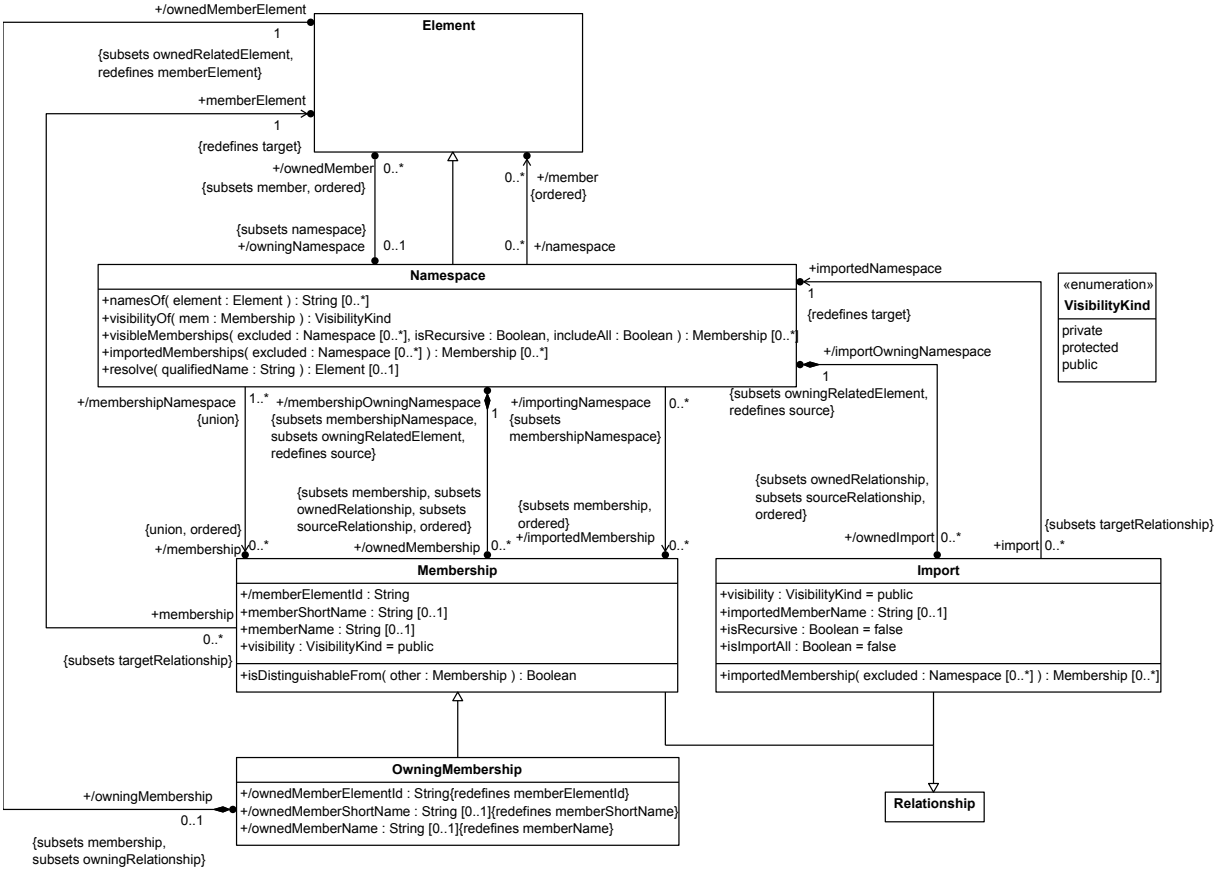

Figure 6. Namespaces

8.3.2.3.2 Import

Description

An Import is a Relationship between an `importOwningNamespace` in which one or more of the visible Memberships of the `importedNamespace` become `importedMemberships` of the `importOwningNamespace`. If `isImportAll = false` (the default), then only public Memberships are considered "visible". If `isImportAll = true`, then all Memberships are considered "visible", regardless of their declared `visibility`.

If no `importedMemberName` is given, then all visible Memberships are imported from the `importedNamespace`. If `isRecursive = true`, then visible Memberships are also recursively imported from all visible `ownedMembers` of the Namespace that are also Namespaces.

If an `importedMemberName` is given, then the Membership whose `effectiveMemberName` is that name is imported from the `importedNamespace`, if it is visible. If `isRecursive = true` and the imported

memberElement is a Namespace, then visible Memberships are also recursively imported from that Namespace and its owned sub-Namespaces.

General Classes

Relationship

Attributes

importedMemberName : String [0..1]

The effectiveMemberName of the Membership of the importedNamspace to be imported. If not given, all public Memberships of the importedNamespace are imported.

importedNamespace : Namespace {redefines target}

The Namespace whose visible members are imported by this Import.

/importOwningNamespace : Namespace {subsets owningRelatedElement, redefines source}

The Namespace into which members are imported by this Import, which must be the owningRelatedElement of the Import.

isImportAll : Boolean

Whether to import memberships without regard to declared visibility.

isRecursive : Boolean

Whether to recursively import Memberships from visible, owned sub-namespaces.

visibility : VisibilityKind

The visibility level of the imported members from this Import relative to the importOwningNamespace.

Operations

importedMembership(excluded : Namespace [0..*]) : Membership [0..*]

Returns the Memberships of the importedNamespace whose memberElements are to become imported members of the importOwningNamespace. By default, this is the set of publicly visible Memberships of the importedNamespace, but this may be overridden in specializations of Import. (The excluded parameter is used to handle the possibility of circular Import Relationships.)

```
body: let exclusions : Set(Namespace) =
    excluded->including(importOwningNamspace) in
let visibleMemberships : Sequence(Membership) =
    importedNamespace.visibleMemberships(exclusions, false, isImportAll) in
let memberships : Sequence(Membership) =
    if importedMemberName = null then visibleMemberships
    else visibleMemberships->select(effectiveMemberName = importedMemberName)
    endif in
if not isRecursive then memberships
else memberships->union(
        memberships.ownedMember->selectAsKind(Namespace).
```

```
        visibleMemberships(exclusions, true, isImportAll))
endif
```

Constraints

None.

8.3.2.3.3 Membership

Description

Membership is a Relationship between a Namespace and an Element that indicates the Element is a `member` of (i.e., is contained in) the Namespace. Any `memberNames` specify how the `memberElement` is identified in the Namespace and the `visibility` specifies whether or not the `memberElement` is publicly visible from outside the Namespace.

If a Membership is an OwningMembership, then it owns its `memberElement`, which becomes an `ownedMember` of the `membershipOwningNamespace`. Otherwise, the `memberNames` of a Membership are effectively aliases within the `membershipOwningNamespace` for an Element with a separate OwningMembership in the same or a different Namespace.

General Classes

Relationship

Attributes

memberElement : Element {redefines target}

The Element that becomes a `member` of the `membershipOwningNamespace` due to this Membership.

/memberElementId : String

The `elementId` of the `memberElement`.

memberName : String [0..1]

The name of the `memberElement` relative to the `membershipOwningNamespace`.

/membershipOwningNamespace : Namespace {subsets membershipNamespace, owningRelatedElement, redefines source}

The Namespace of which the `memberElement` becomes a member due to this Membership.

memberShortName : String [0..1]

The short name of the `memberElement` relative to the `membershipOwningNamespace`.

visibility : VisibilityKind

Whether or not the Membership of the `memberElement` in the `membershipOwningNamespace` is publicly visible outside that Namespace.

Operations

isDistinguishableFrom(other : Membership) : Boolean

Whether this Membership is distinguishable from a given `other` Membership. By default, this is true if this Membership has no `memberShortName` or `memberName`; or each of the `memberShortName` and `memberName` are different than both of those of the `other` Membership; or neither of the metaclasses of the `memberElement` of this Membership and the `memberElement` of the `other` Membership conform to the other. But this may be overridden in specializations of Membership.

```
body: not (memberElement.oclKindOf(other.memberElement.oclType()) or
     other.memberElement.oclKindOf(memberElement.oclType())) or
(shortMemberName = null or
    (shortMemberName <> other.shortMemberName and
     shortMemberName <> other.memberName)) and
(memberName = null or
    (memberName <> other.shortMemberName and
     memberName <> other.memberName)))
```

Constraints

None.

8.3.2.3.4 Namespace

Description

A Namespace is an Element that contains other Elements, known as its `members`, via Membership Relationships with those Elements. The `members` of a Namespace may be owned by the Namespace, aliased in the Namespace, or imported into the Namespace via Import Relationships with other Namespaces.

A Namespace can provide names for its `members` via the `memberNames` specified by the Memberships in the Namespace. If a Membership specifies a `memberName`, then that is the name of the corresponding `memberElement` relative to the Namespace. Note that the same Element may be the `memberElement` of multiple Memberships in a Namespace (though it may be owned at most once), each of which may define a separate alias for the Element relative to the Namespace.

General Classes

Element

Attributes

/importedMembership : Membership [0..*] {subsets membership, ordered}

The Memberships in this Namespace that result from Import Relationships between the Namespace and other Namespaces.

/member : Element [0..*] {ordered}

The set of all member Elements of this Namespace, derived as the `memberElements` of all `memberships` of the Namespace.

/membership : Membership [0..*] {ordered, union}

All Memberships in this Namespace, including (at least) the union of `ownedMemberships` and `importedMemberships`.

/ownedImport : Import [0..*] {subsets sourceRelationship, ownedRelationship, ordered}

The `ownedRelationships` of this Namespace that are Imports, for which the Namespace is the `importOwningNamespace`.

/ownedMember : Element [0..*] {subsets member, ordered}

The owned `members` of this Namespace, derived as the ownedMemberElements of the `ownedMemberships` of the Namespace.

/ownedMembership : Membership [0..*] {subsets membership, sourceRelationship, ownedRelationship, ordered}

The `ownedRelationships` of this Namespace that are Memberships, for which the Namespace is the `membershipOwningNamespace`.

Operations

importedMemberships(excluded : Namespace [0..*]) : Membership [0..*]

Derive the imported Memberships of this Namespace as the `importedMembership` of all `ownedImports`, excluding those Imports whose `importOwningNamespace` is in the `excluded` set, and excluding Memberships that have distinguisibility collisions with each other or with any `ownedMembership`.

```
body: ownedImport->
    excluding(excluded->contains(importOwningNamespace)).
    importedMembership(excluded)
```

namesOf(element : Element) : String [0..*]

Return the names of the given `element` as it is known in this Namespace.

```
body: let elementMemberships : Sequence(Membership) =
    memberships->select(memberElement = element)
in
    memberships.memberShortName->
        union(memberships.memberName)->
        asSet()
```

resolve(qualifiedName : String) : Element [0..1]

Resolve the given qualified name to the named Element (if any), starting with this Namespace as the local scope. The qualified name string must conform to the concrete syntax of the KerML textual notation. According to the KerML name resolution rule every qualified name will resolve to either a single qualified name, or none.

visibilityOf(mem : Membership) : VisibilityKind

Returns this visibility of `mem` relative to this Namespace. If `mem` is an `importedMembership`, this is the `visibility` of its Import. Otherwise it is the `visibility` of the Membership itself.

```
body: if importedMembership->includes(mem) then
    ownedImport->any(importedMembership(Set{})->includes(mem)).visibility
else if memberships->includes(mem) then
    mem.visibility
else
    VisibilityKind::private
endif
```

visibleMemberships(excluded : Namespace [0..*],isRecursive : Boolean,includeAll : Boolean) : Membership [0..*]

If `includeAll = true`, then return all the Memberships of this Namespace. Otherwise, return only the publicly visible Memberships of this Namespace (which includes those `ownedMemberships` that have a `visibility` of `public` and those `importedMemberships` imported with a `visibility` of `public`). If `isRecursive = true`, also recursively include all visible Memberships of any visible owned Namespaces.

```
body: let publicMemberships : Sequence(Membership) =
    ownedMembership->
        select(visibility = VisibilityKind::public)->
        union(ownedImport->
            select(visibility = VisibilityKind::public).
            importedMembership(excluded)) in
if not isRecursive then publicMemberships
else publicMemberships->union(publicMemberships->
        selectAsKind(Namespace).
        publicMembership(excluded->including(this), true))
endif
```

Constraints

deriveNamespaceMembers

The `members` of a Namespace are the `memberElements` of all its `memberships`.

```
member = membership.memberElement
```

deriveNamespaceOwnedMember

The `ownedMembers` of a Namespace are the `ownedMemberElements` of all its `ownedMemberships` that are OwningMemberships.

```
ownedMember = ownedMembership->selectByKind(OwningMembership).ownedMemberElement
```

deriveNamespaceOwnedMembership

The `ownedMemberships` of a Namespace are all its `ownedRelationships` that are Memberships.

```
ownedMembership = ownedRelationship->selectByKind(Membership)
```

deriveNamespaceOwnedImport

The `ownedImports` of a Namespace are all its `ownedRelationships` that are Imports.

```
ownedImport = ownedRelationship->selectByKind(Import)
```

validateNamespaceDistinguishibility

All `memberships` of a Namespace must be distinguishable from each other.

```
membership->forAll(m1 | membership->forAll(m2 | m1 <> m2 implies m1.isDistinguishableFrom(m2)))
```

deriveNamespaceImportedMembership

The `importedMemberships` of a Namespace are derived using the `importedMemberships()` operation,with no initially `excluded` Namespaces.

```
importedMembership = importedMemberships(Set{})
```

8.3.2.3.5 VisibilityKind

Description

VisibilityKind is an enumeration whose literals specify the visibility of a Membership of an Element in a Namespace outside of that Namespace. Note that "visibility" specifically restricts whether an Element in a Namespace may be referenced by name from outside the Namespace and only otherwise restricts access to an Element as provided by specific constraints in the abstract syntax (e.g., preventing the import or inheritance of private Elements).

General Classes

None.

Literal Values

private

Indicates a Membership is not visible outside its owning Namespace.

protected

An intermediate level of visibility between `public` and `private`. By default, it is equivalent to `private` for the purposes of normal access to and import of Elements from a Namespace. However, other Relationships may be specified to include Memberships with `protected` visibility in the list of `memberships` for a Namespace (e.g., Generalization).

public

Indicates that a Membership is publicly visible outside its owning Namespace.

8.3.2.3.6 OwningMembership

Description

An OwningMembership is a Membership that owns its `memberElement` as a `ownedRelatedElement`. The `ownedMemberElementM` becomes an `ownedMember` of the `membershipOwningNamespace`.

General Classes

Membership

Attributes

/ownedMemberElement : Element {subsets ownedRelatedElement, redefines memberElement}

The Element that becomes an `ownedMember` of the `membershipOwningNamespace` due to this OwningMembership. Derived as the first `ownedRelatedElement` of the OwningRelationship.

/ownedMemberElementId : String {redefines memberElementId}

The `elementId` of the `ownedMemberElement`.

/ownedMemberName : String [0..1] {redefines memberName}

The `effectiveName` of the `ownedMemberElement`.

/ownedMemberShortName : String [0..1] {redefines memberShortName}

The `shortName` of the `ownedMemberElement`.

Operations

No operations.

Constraints

deriveOwningMembershipOwnedMemberShortName

The `ownedMemberName` of an OwningMembership is the `effectiveName` of its `ownedMemberElement`.

```
ownedMemberShortName = ownedMemberElement.shortName
```

deriveOwningMembershipOwnedMemberName

The `ownedMemberName` of an OwningMembership is the `effectiveName` of its `ownedMemberElement`.

```
ownedMemberName = ownedMemberElement.effectiveName
```

8.3.3 Core Abstract Syntax

8.3.3.1 Types Abstract Syntax

8.3.3.1.1 Overview

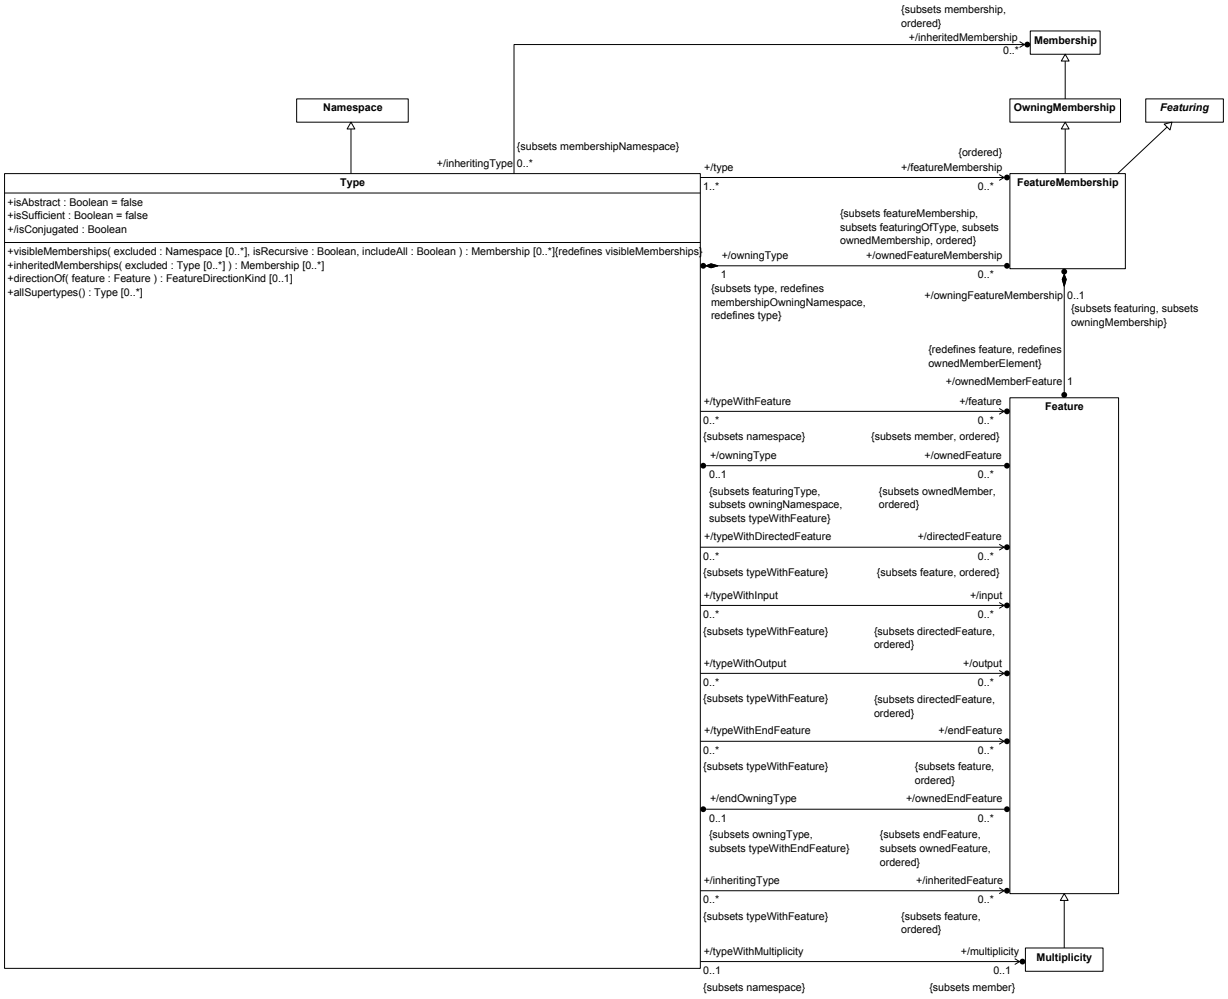

Figure 7. Types

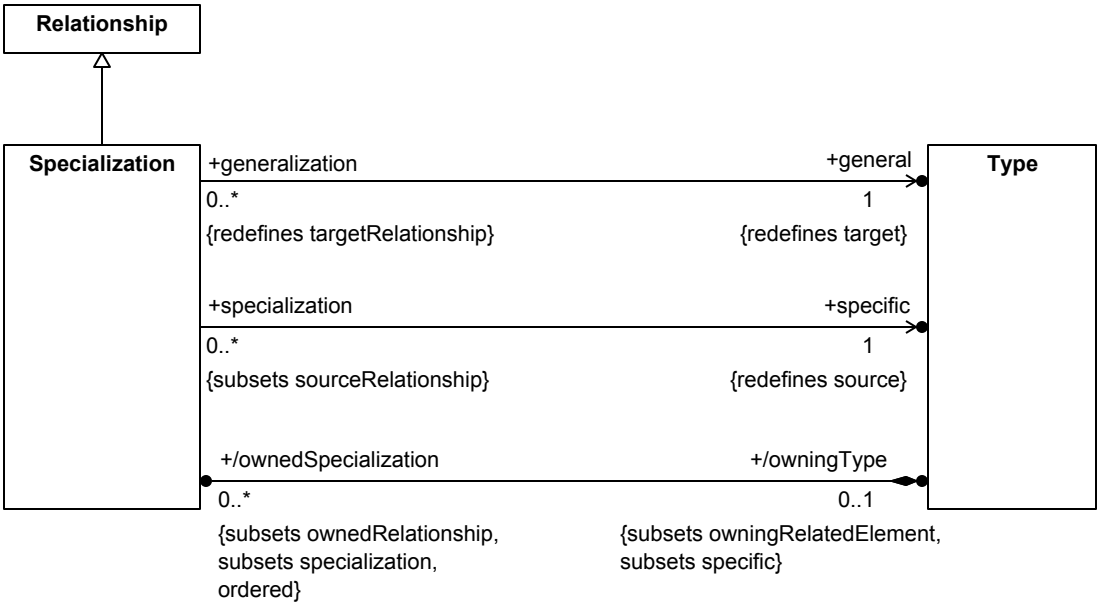

Figure 8. Specialization

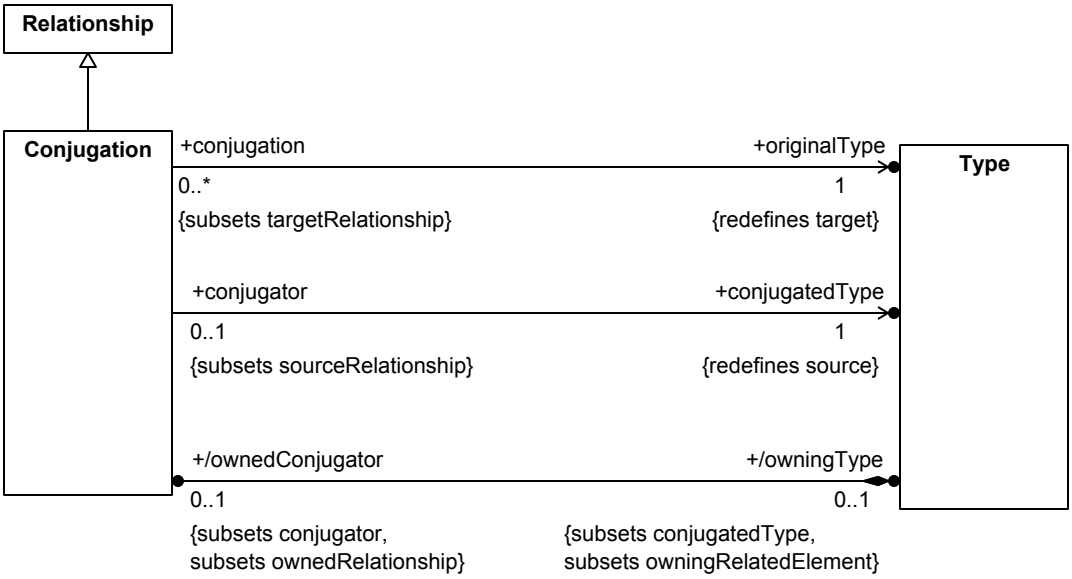

Figure 9. Conjugation

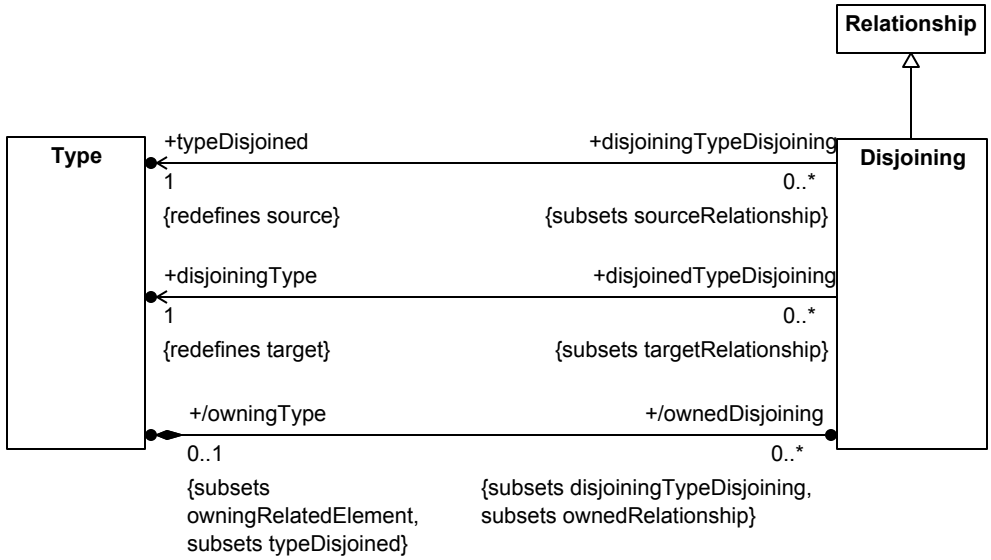

Figure 10. Disjoining

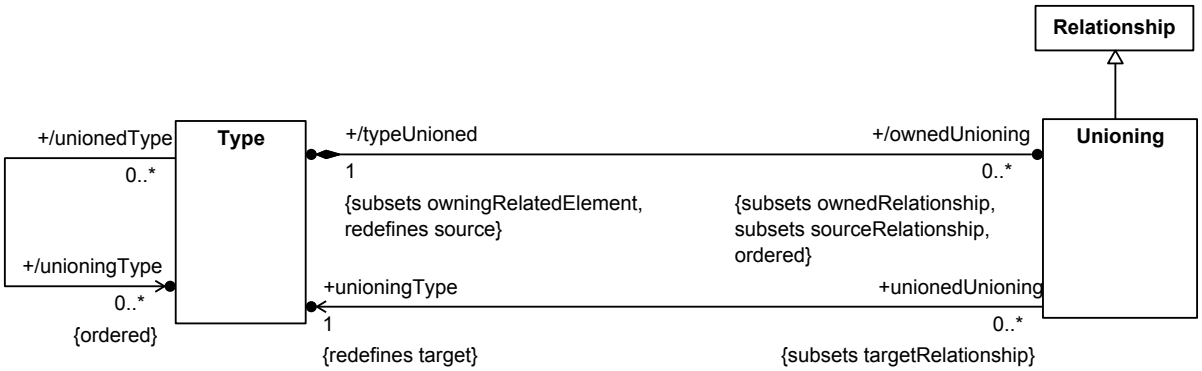

Figure 11. Unioning

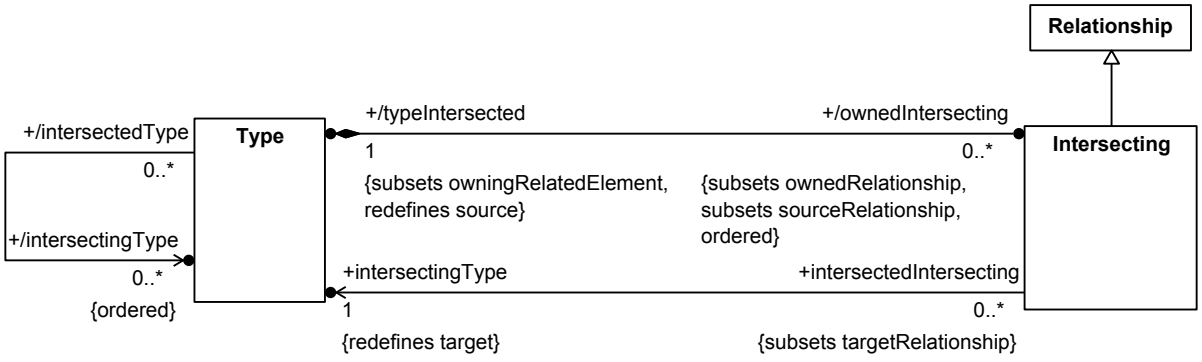

Figure 12. Intersecting

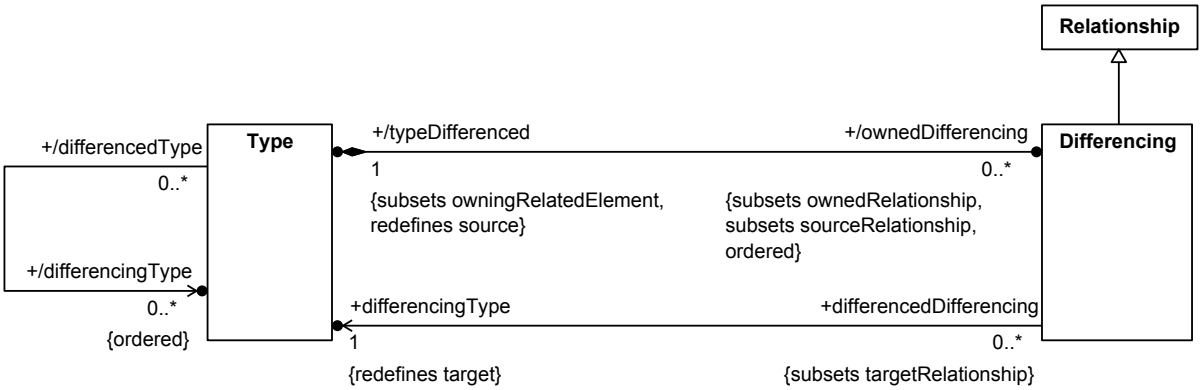

Figure 13. Differencing

8.3.3.1.2 Conjugation

Description

Conjugation is a Relationship between two types in which the `conjugatedType` inherits all the Features of the `originalType`, but with all `input` and `output` Features reversed. That is, any Features with a FeatureMembership with `direction` *in* relative to the `originalType` are considered to have an effective `direction` of *out* relative to the `conjugatedType` and, similarly, Features with `direction` *out* in the `originalType` are considered to have an effective `direction` of *in* in the `originalType`. Features with `direction` *inout*, or with no `direction`, in the `originalType`, are inherited without change.

A Type may participate as a `conjugatedType` in at most one Conjugation relationship, and such a Type may not also be the `specific` Type in any Generalization relationship.

General Classes

Relationship

Attributes

conjugatedType : Type {redefines source}

The Type that is the result of applying Conjugation to the `originalType`.

originalType : Type {redefines target}

The Type to be conjugated.

/owningType : Type [0..1] {subsets conjugatedType, owningRelatedElement}

The `conjugatedType` of this Type that is also its `owningRelatedElement`.

Operations

No operations.

Constraints

None.

8.3.3.1.3 Differencing

Description

Differencing is a Relationship that makes its `differencingType` one of the `differencingTypes` of its `typeDifferenced`.

General Classes

Relationship

Attributes

differencingType : Type {redefines target}

Type that partly determines interpretations of `typeDifferenced`, as described in `Type::differencingType`.

/typeDifferenced : Type {subsets owningRelatedElement, redefines source}

Type with interpretations partly determined by `differencingType`, as described in `Type::differencingType`.

Operations

No operations.

Constraints

None.

8.3.3.1.4 Disjoining

Description

A Disjoining is a Relationship between Types asserted to have interpretations that are not shared (disjoint) between them, identified as `typeDisjoined` and `disjoiningType`. For example, a Classifier for mammals is disjoint from a Classifier for minerals, and a Feature for people's parents is disjoint from a Feature for their children.

General Classes

Relationship

Attributes

disjoiningType : Type {redefines target}

Type asserted to be disjoint with the `typeDisjoined`.

/owningType : Type [0..1] {subsets typeDisjoined, owningRelatedElement}

A `typeDisjoined` that is also an `owningRelatedElement`.

typeDisjoined : Type {redefines source}

Type asserted to be disjoint with the `disjoiningType`.

Operations

No operations.

Constraints

None.

8.3.3.1.5 FeatureDirectionKind

Description

FeatureDirectionKind enumerates the possible kinds of `direction` that a Feature may be given as a member of a Type.

General Classes

None.

Literal Values

in

Values of the Feature on each instance of its domain are determined externally to that instance and used internally.

inout

Values of the Feature on each instance are determined either as *in* or *out* directions, or both.

out

Values of the Feature on each instance of its domain are determined internally to that instance and used externally.

8.3.3.1.6 FeatureMembership

Description

FeatureMembership is an OwningMembership for a Feature in a Type that is also a Featuring Relationship between the Feature and the Type, in which the `featuringType` is the `source` and the `featureOfType` is the `target`. A FeatureMembership is always owned by its `owningType`, which is the `featuringType` for the FeatureMembership considered as a Featuring.

General Classes

Featuring
OwningMembership

Attributes

/ownedMemberFeature : Feature {redefines ownedMemberElement, feature}

The Feature that this FeatureMembership relates to its `owningType`, making it an `ownedFeature` of the `owningType`.

/owningType : Type {subsets type, redefines membershipOwningNamespace, type}

The Type that owns this FeatureMembership.

Operations

No operations.

Constraints

None.

8.3.3.1.7 Intersecting

Description

Intersecting is a Relationship that makes its `intersectingType` one of the `intersectingTypes` of its `typeIntersected`.

General Classes

Relationship

Attributes

intersectingType : Type {redefines target}

Type that partly determines interpretations of `typeIntersected`, as described in `Type::intersectingType`.

/typeIntersected : Type {subsets owningRelatedElement, redefines source}

Type with interpretations partly determined by `intersectingType`, as described in `Type::intersectingType`.

Operations

No operations.

Constraints

None.

8.3.3.1.8 Specialization

Description

Specialization is a Relationship between two Types that requires all instances of the `specific` type to also be instances of the `general` Type (i.e., the set of instances of the `specific` Type is a *subset* of those of the `general` Type, which might be the same set).

General Classes

Relationship

Attributes

general : Type {redefines target}

A Type with a superset of all instances of the `specific` Type, which might be the same set.

/owningType : Type [0..1] {subsets specific, owningRelatedElement}

The Type that is the `specific` Type of this Specialization and owns it as its `owningRelatedElement`.

specific : Type {redefines source}

A Type with a subset of all instances of the `general` Type, which might be the same set.

Operations

No operations.

Constraints

validateGeneralizationSpecificNotConjugated

The `specific` Type of a Generalization cannot be a conjugated Type.

```
not specific.isConjugated
```

8.3.3.1.9 Multiplicity

Description

A Multiplicity is a Feature whose co-domain is a set of natural numbers that includes the number of sequences determined below, based on the kind of typeWithMultiplicity:

- Classifiers: minimal sequences (the single length sequences of the Classifier).
- Features: sequences with the same feature-pair head. In the case of Features with Classifiers as domain and co-domain, these sequences are pairs, with the first element in a single-length sequence of the domain Classifier (head of the pair), and the number of pairs with the same first element being among the Multiplicity co-domain numbers.

Multiplicity co-domains (in models) can be specified by Expression that might vary in their results. If the `typeWithMultiplicity` is a Classifier, the domain of the Multiplicity shall be *Anything*. If the `typeWithMultiplicity` is a Feature, the Multiplicity shall have the same domain as the `typeWithMultiplicity`.

General Classes

Feature

Attributes

None.

Operations

No operations.

Constraints

checkMultiplicityTypeFeaturing

[no documentation]

8.3.3.1.10 Type

Description

A Type is a Namespace that is the most general kind of Element supporting the semantics of classification. A Type may be a Classifier or a Feature, defining conditions on what is classified by the Type (see also the description of `isSufficient`).

General Classes

Namespace

Attributes

/differencingType : Type [0..*] {ordered}

The interpretations of a Type with `differencingTypes` are asserted to be those of the first of those Types, but not including those of the remaining types. For example, a Classifier might be the difference of a Classifier for people and another for people of a particular nationality, leaving people who are not of that nationality. Similarly, a feature of people might be the difference between a feature for their children and a Classifier for people of a particular sex, identifying their children not of that sex (because the interpretations of the children feature that identify those of that sex are also interpretations of the Classifier for that sex).

/directedFeature : Feature [0..*] {subsets feature, ordered}

The `features` of this Type that have a non-null `direction`.

/endFeature : Feature [0..*] {subsets feature, ordered}

All `features` related to this Type by EndFeatureMemberships.

/feature : Feature [0..*] {subsets member, ordered}

The `ownedMemberFeatures` of the `featureMemberships` of this Type.

/featureMembership : FeatureMembership [0..*] {ordered}

The FeatureMemberships for `features` of this Type, which include all `ownedFeatureMemberships` and those `inheritedMemberships` that are FeatureMemberships (but does *not* include any `importedMemberships`).

/inheritedFeature : Feature [0..*] {subsets feature, ordered}

All the `memberFeatures` of the `inheritedMemberships` of this Type.

/inheritedMembership : Membership [0..*] {subsets membership, ordered}

All Memberships inherited by this Type via Generalization or Conjugation. These are included in the derived union for the `memberships` of the Type.

/input : Feature [0..*] {subsets directedFeature, ordered}

All `features` related to this Type by FeatureMemberships that have `direction` `in or inout`.

/intersectingType : Type [0..*] {ordered}

The interpretations of a Type with code>intersectingTypes are asserted to be those in common among the `intersectingTypes`, which are the Types derived from the `intersectingType` of the `ownedIntersectings` of this Type. For example, a Classifier might be an intersection of Classifiers for people of a particular sex and of a particular nationality. Similarly, a feature for people's children of a particular sex might be the intersection of a feature for their children and a Classifier for people of that sex (because the interpretations of the children feature that identify those of that sex are also interpretations of the Classifier for that sex).

isAbstract : Boolean

Indicates whether instances of this Type must also be instances of at least one of its specialized Types.

/isConjugated : Boolean

Indicates whether this Type has an `ownedConjugator`. (See Conjugation.)

isSufficient : Boolean

Whether all things that meet the classification conditions of this Type must be classified by the Type.

(A Type gives conditions that must be met by whatever it classifies, but when `isSufficient` is false, things may meet those conditions but still not be classified by the Type. For example, a Type *`Car`* that is not sufficient could require everything it classifies to have four wheels, but not all four wheeled things would need to be cars. However, if the type *`Car`* were sufficient, it would classify all four-wheeled things.)

/multiplicity : Multiplicity [0..1] {subsets member}

The one `member` (at most) of this Type that is a Multiplicity, which constrains the cardinality of the Type. A `multiplicity` can be owned or inherited. If it is owned, the `multiplicity` must redefine the `multiplicity` (if it has one) of any `general` Type of a `Generalization` of this Type.

/output : Feature [0..*] {subsets directedFeature, ordered}

All `features` related to this Type by FeatureMemberships that have `direction` `out or inout`.

/ownedConjugator : Conjugation [0..1] {subsets ownedRelationship, conjugator}

A Conjugation owned by this Type for which the Type is the `originalType`.

/ownedDifferencing : Differencing [0..*] {subsets sourceRelationship, ownedRelationship, ordered}

The `ownedRelationships` of this Type that are Differencings, having this Type as their `typeDifferenced`.

/ownedDisjoining : Disjoining [0..*] {subsets ownedRelationship, disjoiningTypeDisjoining}

The `ownedRelationships` of this Type that are Disjoinings, for which the Type is the `typeDisjoined` Type.

/ownedEndFeature : Feature [0..*] {subsets endFeature, ownedFeature, ordered}

All `endFeatures` of this Type that are `ownedFeatures`.

/ownedFeature : Feature [0..*] {subsets ownedMember, ordered}

The `ownedMemberFeatures` of the `ownedFeatureMemberships` of this Type.

/ownedFeatureMembership : FeatureMembership [0..*] {subsets ownedMembership, featureMembership, featuringOfType, ordered}

The `ownedMemberships` of this Type that are FeatureMemberships, for which the Type is the `owningType`. Each such FeatureMembership identifies an `ownedFeature` of the Type.

/ownedIntersecting : Intersecting [0..*] {subsets ownedRelationship, sourceRelationship, ordered}

The `ownedRelationships` of this Type that are Intersectings, have the Type as their `typeIntersected`.

/ownedSpecialization : Specialization [0..*] {subsets specialization, ownedRelationship, ordered}

The `ownedRelationships` of this Type that are Specializations, for which the Type is the `specific` Type.

/ownedUnioning : Unioning [0..*] {subsets ownedRelationship, sourceRelationship, ordered}

The `ownedRelationships` of this Type that are Unionings, having the Type as their `typeUnioned`.

/unioningType : Type [0..*] {ordered}

The interpretations of a Type with code>unioningTypes are asserted to be the same as those of all the `unioningTypes` together, which are the Types derived from the `unioningType` of the `ownedUnionings` of this Type. For example, a Classifier for people might be the union of Classifiers for all the sexes. Similarly, a feature for people's children might be the union of features dividing them in the same ways as people in general.

Operations

allSupertypes() : Type [0..*]

Return all Types related to this Type as supertypes directly or transitively by Generalization Relationships.

```
body: ownedSpecialization->
    closure(general.ownedSpecialization).general->
    including(self)
```

directionOf(feature : Feature) : FeatureDirectionKind [0..1]

If the given feature is a feature of this type, then return its direction relative to this type, taking conjugation into account.

```
body: if input->includes(feature) and output->includes(feature) then
    FeatureDirectionKind::inout
else if input->includes(feature) then
    FeatureDirectionKind::_'in'
else if output->includes(feature) then
    FeatureDirectionKind::out
else
    null
endif endif endif
```

inheritedMemberships(excluded : Type [0..*]) : Membership [0..*]

Return the inherited Memberships of this Type, excluding those supertypes in the `excluded` set.

visibleMemberships(excluded : Namespace [0..*],isRecursive : Boolean,includeAll : Boolean) : Membership [0..*]

The visible Memberships of a Type include `inheritedMemberships`.

```
body: let visibleInheritedMemberships : Sequence(Membership) =
    inheritedMemberships(excluded)->
        select(includeAll or visibility = VisibilityKind::public) in
self.oclAsType(Namespace).visibleMemberships(excluded, isRecursive, includeAll)->
    union(visibleInheritedMemberships)
```

Constraints

deriveTypeOwnedConjugator

[no documentation]

```
let ownedConjugators: Sequence(Conjugator) =
    ownedRelationship->selectByKind(Conjugation) in
    ownedConjugator =
        if ownedConjugators->isEmpty() then null
        else ownedConjugators->at(1) endif
```

checkTypeSpecialization

A Type must directly or indirectly specialize *`Base::Anything`* from the Kernel Semantic Library.

```
allSupertypes()->includes(resolve("Base::Anything"))
```

deriveTypeDifferencingType

The `differencingTypes` of a Type are the `differencingTypes` of its `ownedDifferencings`, in the same order.

```
differencingType = ownedDifferencing.differencingType
```

validateTypeIntersectingTypesNotSelf

A Type cannot be one of its own `intersectingTypes`.

```
intersectingType->excludes(self)
```

deriveTypeUnioningType

The `unioningTypes` of a Type are the `unioningTypes` of its `ownedUnionings`.

```
unioningType = ownedUnioning.unioningType
```

deriveTypeOwnedSpecialization

[no documentation]

```
ownedSpecialization = ownedRelationship->selectByKind(Specialization)->
    select(g | g.special = self)
```

deriveTypeOutput

If this Type is conjugated, then its `outputs` are the `inputs` of the `originalType`. Otherwise, its `outputs` are all `features` with FeatureMembership `direction` of `out` or `inout`.

```
output =
    if isConjugated then
        conjugator.originalType.input
    else
        feature->select(direction = out or direction = inout)
    endif
```

deriveTypeIntersectingType

The `intersectingTypes` of a Type are the `intersectingTypes` of its `ownedIntersectings`.

```
intersectingType = ownedIntersecting.intersectingType
```

deriveTypeMultiplicity

The `multiplicity` of this Type is all its `features` that are Multiplicities. (There must be at most one.)

```
multiplicity = feature->select(oclIsKindOf(Multiplicity))
```

deriveTypeInheritedMembership

[no documentation]

```
inheritedMembership = inheritedMemberships(Set{})
```

validateTypeDifferencingTypesNotSelf

A Type cannot be one of its own `differencingTypes`.

```
differencingType->excludes(self)
```

deriveTypeDirectedFeature

[no documentation]

```
directedFeature = feature->select(direction <> null)
```

deriveTypeFeatureMembership

The `featureMemberships` of a Type is the union of the `ownedFeatureMemberships` and those `inheritedMemberships` that are FeatureMemberships.

```
featureMembership = ownedMembership->union(
    inheritedMembership->selectByKind(FeatureMembership))
```

deriveTypeFeature

The `features` of a Type are the `ownedMemberFeatures` of its `featureMemberships`.

```
feature = featureMembership.ownedMemberFeature
```

deriveTypeOwnedFeature

The ownedFeatures of a Type are the ownedMemberFeatures of its ownedFeatureMemberships.

```
ownedFeature = ownedFeatureMembership.ownedMemberFeature
```

deriveTypeDisjointType

[no documentation]

```
disjointType = disjoiningTypeDisjoining.disjoiningType
```

validateTypeUnioningTypesNotSelf

A Type cannot be one of its own unioningTypes.

```
unioningType->excludes(self)
```

checkTypeSemanticSpecialization

[no documentation]

validateTypeAtMostOneConjugator

[no documentation]

```
ownedRelationship->selectByKind(Conjugator)->size() <= 1
```

deriveTypeOwnedFeatureMembership

The ownedFeatureMemberships of a Type are its ownedMemberships that are FeatureMemberships.

```
ownedFeatureMembership = ownedRelationship->selectByKind(FeatureMembership)
```

deriveTypeInput

If this Type is conjugated, then its inputs are the outputs of the originalType. Otherwise, its inputs are all features with FeatureMembership direction of in or inout.

```
input =
    if isConjugated then
        conjugator.originalType.output
    else
        feature->select(direction = _'in' or direction = inout)
    endif
```

8.3.3.1.11 Unioning

Description

Unioning is a Relationship that makes its unioningType one of the unioningTypes of its typeUnioned.

General Classes

Relationship

Attributes

/typeUnioned : Type {subsets owningRelatedElement, redefines source}

Type with interpretations partly determined by `unioningType`, as described in `Type::unioningType`.

unioningType : Type {redefines target}

Type that partly determines interpretations of `typeUnioned`, as described in `Type::unioningType`.

Operations

No operations.

Constraints

None.

8.3.3.2 Classifiers Abstract Syntax

8.3.3.2.1 Overview

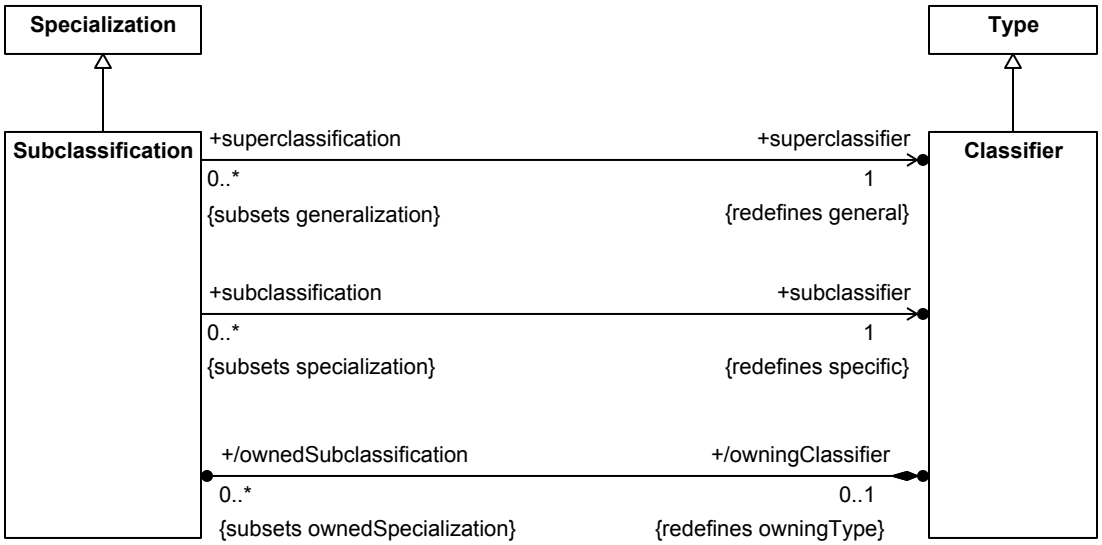

Figure 14. Classifiers

8.3.3.2.2 Classifier

Description

A Classifier is a Type for model elements that classify:

- Things (in the universe) regardless of how Features relate them. These are sequences of exactly one thing (sequence of length 1).
- How the above things are related by Features. These are sequences of multiple things (length > 1).

Classifiers that classify relationships (sequence length > 1) must also classify the things at the end of those sequences (sequence length =1). Because of this, Classifiers specializing Features cannot classify anything (any sequences).

General Classes

Type

Attributes

/ownedSubclassification : Subclassification [0..*] {subsets ownedSpecialization}

The `ownedSpecializations` of this Classifier that are Subclassifications, for which this Classifier is the `subclassifier`.

Operations

No operations.

Constraints

deriveClassifierOwnedSubclassification

[no documentation]

```
ownedSubclassification =
    ownedSpecialization->selectByKind(Superclassification)
```

checkClassifierSemanticSpecialization

[no documentation]

validateClassifierMultiplicityDomain

If a Classifier has a `multiplicity`, then the `multiplicity` shall have no `featuringTypes` (meaning that its domain is implicitly *Base::Anything*).

```
multiplicity <> null implies multiplicity.featuringType->isEmpty()
```

8.3.3.2.3 Subclassification

Description

Subclassification is Specialization in which both the `specific` and `general` Types are Classifiers. This means all instances of the specific Classifier are also instances of the general Classifier.

General Classes

Specialization

Attributes

/owningClassifier : Classifier [0..1] {redefines owningType}

The Classfier that owns this Subclassification relationship, which must also be its `subclassifier`.

subclassifier : Classifier {redefines specific}

The more specific Classifier in this Subclassification.

superclassifier : Classifier {redefines general}

The more general Classifier in this Subclassification.

Operations

No operations.

Constraints

None.

8.3.3.3 Features Abstract Syntax

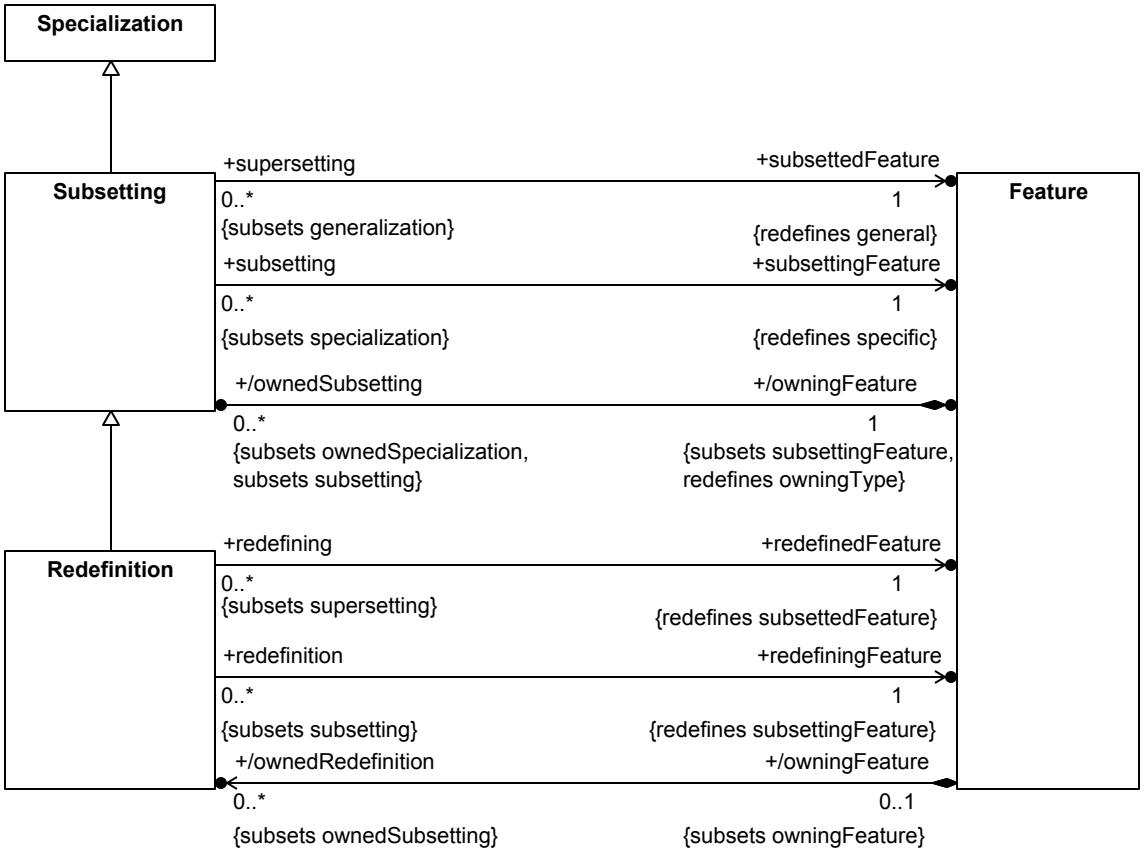

Figure 16. Subsetting

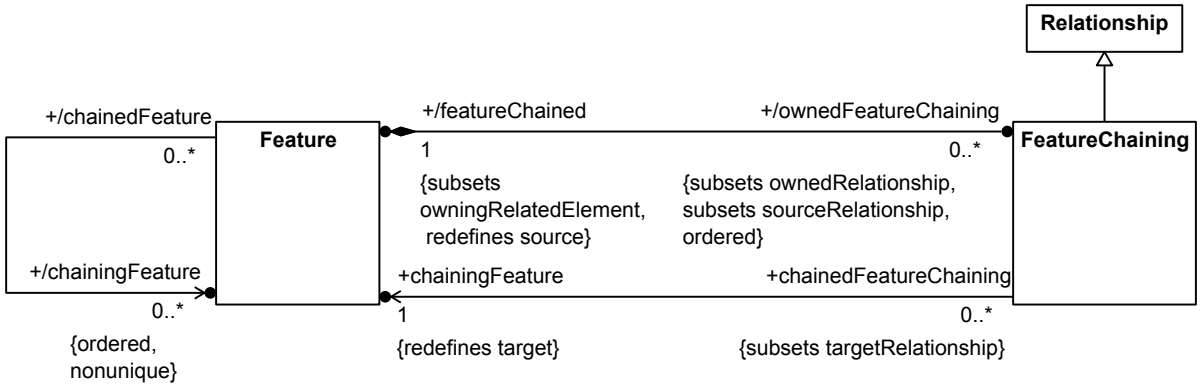

Figure 17. Feature Chaining

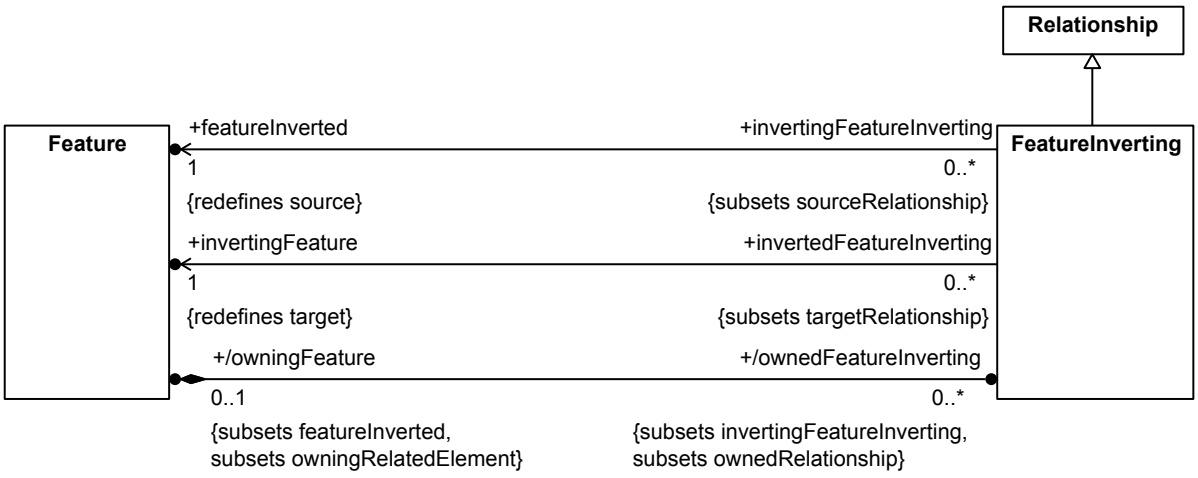

Figure 18. Feature Inverting

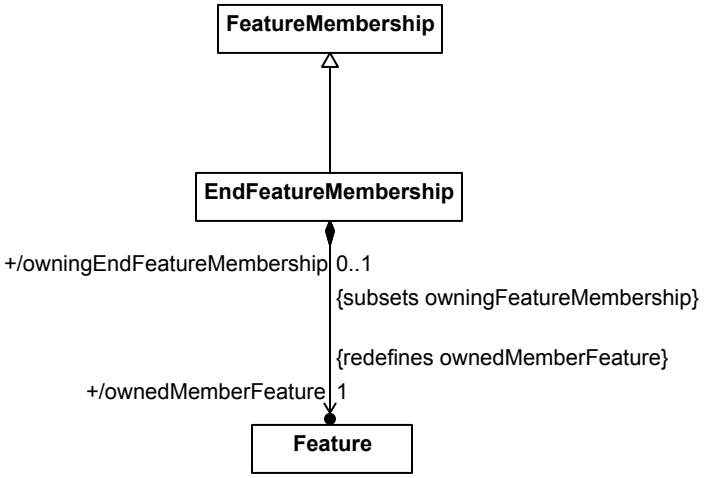

Figure 19. End Feature Membership

8.3.3.3.2 EndFeatureMembership

Description

EndFeatureMembership is a FeatureMembership that requires its `memberFeature` be owned and have `isEnd = true`.

General Classes

FeatureMembership

Attributes

/ownedMemberFeature : Feature {redefines ownedMemberFeature}

Operations

No operations.

Constraints

validateEndFeatureMembershipIsEnd

The `ownedMemberFeature` of an EndFeatureMembership must be an end Feature.

```
ownedMemberFeature.isEnd
```

8.3.3.3.3 Feature

Description

A Feature is a Type that classifies sequences of multiple things (in the universe). These must concatenate a sequence drawn from the intersection of the Feature's `featuringTypes` (*domain*) with a sequence drawn from the intersection of its `types` (*co-domain*), treating (co)domains as sets of sequences. The domain of Features that do not have any `featuringTypes` is the same as if it were the library Type Anything. A Feature's `types` include at least Anything, which can be narrowed to other Classifiers by Redefinition.

In the simplest cases, a Feature's `featuringTypes` and `types` are Classifiers, its sequences being pairs (length = 2), with the first element drawn from the Feature's domain and the second element from its co-domain (the Feature "value"). Examples include cars paired with wheels, people paired with other people, and cars paired with numbers representing the car length.

Since Features are Types, their `featuringTypes` and `types` can be Features. When both are, Features classify sequences of at least four elements (length > 3), otherwise at least three (length > 2). The `featuringTypes` of *nested* Features are Features.

The values of a Feature with `chainingFeatures` are the same as values of the last Feature in the chain, which can be found by starting with values of the first Feature, then from those values to values of the second feature, and so on, to values of the last feature.

General Classes

Type

Attributes

/chainingFeature : Feature [0..*] {ordered, nonunique}

The Features that are chained together to determine the values of this Feature, derived from the `chainingFeatures` of the `ownedFeatureChainings` of this Feature, in the same order. The values of a Feature with chainingFeatures are the same as values of the last Feature in the chain, which can be found by starting with the values of the first Feature (for each instance of the original Feature's domain), then on each of those to the values of the second Feature in chainingFeatures, and so on, to values of the last Feature. The Features related to a Feature by a FeatureChaining are identified as its chainingFeatures.

direction : FeatureDirectionKind [0..1]

Determines how values of this Feature are determined or used (see FeatureDirectionKind).

/endOwningType : Type [0..1] {subsets typeWithEndFeature, owningType}

The Type that is related to this Feature by an EndFeatureMembership in which the Feature is an `ownedMemberFeature`.

/featuringType : Type [0..*] {ordered}

Types that feature this Feature, such that any instance in the domain of the Feature must be classified by all of these Types, including at least all the `featuringTypes` of its `ownedTypeFeaturings`.

isComposite : Boolean

Whether the Feature is a composite `feature` of its `featuringType`. If so, the values of the Feature cannot exist after the instance of the `featuringType` no longer does.

.

isDerived : Boolean

Whether the values of this Feature can always be computed from the values of other Features.

isEnd : Boolean

Whether or not the this Feature is an end Feature, requiring a different interpretation of the `multiplicity` of the Feature.

An end Feature is always considered to map each domain entity to a single co-domain entity, whether or not a Multiplicity is given for it. If a Multiplicity is given for an end Feature, rather than giving the co-domain cardinality for the Feature as usual, it specifies a cardinality constraint for *navigating* across the `endFeatures` of the `featuringType` of the end Feature. That is, if a Type has *n* `endFeatures`, then the Multiplicity of any one of those end Features constrains the cardinality of the set of values of that Feature when the values of the other *n-1* end Features are held fixed.

isOrdered : Boolean

Whether an order exists for the values of this Feature or not.

isPortion : Boolean

Whether the values of this Feature are contained in the space and time of instances of the Feature's domain.

isReadOnly : Boolean

Whether the values of this Feature can change over the lifetime of an instance of the domain.

isUnique : Boolean

Whether or not values for this Feature must have no duplicates or not.

/ownedFeatureChaining : FeatureChaining [0..*] {subsets sourceRelationship, ownedRelationship, ordered}

The FeatureChainings that are among the `ownedRelationships of this Feature (identify their featureChained also as an owningRelatedElement).`

/ownedFeatureInverting : FeatureInverting [0..*] {subsets ownedRelationship, invertingFeatureInverting}

The `ownedRelationships` of this Feature that are FeatureInvertings, for which the Feature is the `featureInverted`.

/ownedRedefinition : Redefinition [0..*] {subsets ownedSubsetting}

The `ownedSubsettings` of this Feature that are Redefinitions, for which the Feature is the `redefiningFeature`.

/ownedReferenceSubsetting : ReferenceSubsetting [0..1] {subsets ownedSubsetting}

The one `ownedSubsetting` of this Feature, if any, that is a ReferenceSubsetting, for which the Feature is the `referencingFeature`.

/ownedSubsetting : Subsetting [0..*] {subsets ownedSpecialization, subsetting}

The `ownedGeneralizations` of this Feature that are Subsettings, for which the Feature is the `subsettingFeature`.

/ownedTypeFeaturing : TypeFeaturing [0..*] {subsets ownedRelationship, typeFeaturing, ordered}

The `ownedRelationships` of this Feature that are TypeFeaturings, for which the Feature is the `featureOfType`.

/ownedTyping : FeatureTyping [0..*] {subsets ownedSpecialization, typing, ordered}

The `ownedGeneralizations` of this Feature that are FeatureTypings, for which the Feature is the `typedFeature`.

/owningFeatureMembership : FeatureMembership [0..1] {subsets owningMembership, featuring}

The FeatureMembership that owns this Feature as an `ownedMemberFeature`, determining its `owningType`.

/owningType : Type [0..1] {subsets typeWithFeature, owningNamespace, featuringType}

The Type that is the `owningType` of the `owningFeatureMembership` of this Type.

/type : Type [0..*] {ordered}

Types that restrict the values of this Feature, such that the values must be instances of all the types. The types of a Feature are derived from its `ownedFeatureTypings` and the `types` of its `ownedSubsettings`.

Operations

directionFor(type : Type) : FeatureDirectionKind [0..1]

Return the `directionOf` this Feature relative to the given `type`.

body: `type.directionOf(self)`

effectiveName() : String [0..1]

If a Feature has no `name`, then its effective name is given by the effective name of the Feature returned by `namingFeature`, if any.

```
body: if name <> null then
    name
else
    let namingFeature : Feature = namingFeature() in
    if namingFeature = null then
        null
    else
        namingFeature.effectiveName()
```

```
    endif
endif
```

isFeaturedWithin(type : Type [0..1]) : Boolean

Return whether this Feature has the given `type` as a direct or indirect `featuringType`. If `type` is null, then check if this Feature is implicitly directly or indirectly featured in *Base::Anything*.

```
body: type = null and feature.featuringType->isEmpty() or
    type <> null and feature.featuringType->includes(type) or
    feature.featuringType->exists(t |
        t.oclIsKindOf(Feature) and
        t.oclAsType(Feature).isFeaturedWithin(type))
```

namingFeature() : Feature [0..1]

By default, the naming feature of a Feature is given by its first redefined Feature, if any.

```
body: let redefinitions : Sequence(Redefinition) = ownedRedefinition in
if redefinitions->isEmpty() then
    null
else
    redefinitions->at(1).redefinedFeature
endif
```

Constraints

validateFeatureChainingFeatureNotOne

[no documentation]

```
chainingFeatures->size() <> 1
```

deriveFeatureOwnedRedefinition

[no documentation]

```
ownedRedefinition = ownedSubsetting->selectByKind(Redefinition)
```

validateFeatureMultiplicityDomain

If a Feature has a `multiplicity`, then the `featuringTypes` of the `multiplicity` must be the same as those of the Feature itself.

```
multiplicity <> null implies multiplicity.featuringType = featuringType
```

deriveFeatureOwnedTypeFeaturing

[no documentation]

```
ownedTypeFeaturing = ownedRelationship->selectByKind(TypeFeaturing)->
    select(tf | tf.featureOfType = self)
```

checkFeatureEndRedefinition

[no documentation]

deriveFeatureOwnedTyping

[no documentation]

```
ownedTyping = ownedGeneralization->selectByKind(FeatureTyping)
```

checkFeatureOccurrenceSpecialization

If a Feature has an `ownedTyping` relationship to a Class, then it must directly or indirectly specialize *`Occurrences::occurrences`* from the Kernel Semantic Library.

```
ownedTyping.type->exists(selectByKind(Class)) implies
    allSupertypes()->includes(resolve("Occurrences::occurrences"))
```

deriveFeatureIsEnd

[no documentation]

```
isEnd = owningFeatureMembership <> null and owningFeatureMembership.oclIsKindOf(EndFeatureMembership
```

deriveFeatureType

If a Feature has `chainingFeatures`, then its `types` are the same as the last `chainingFeature`. Otherwise its `types` are the union of the `types` of its `ownedTypings` and the `types` of the `subsettedFeatures` of its `ownedSubsettings`, with all redundant supertypes removed.

.

deriveFeatureOwnedSubsetting

[no documentation]

```
ownedSubsetting = ownedGeneralization->selectByKind(Subsetting)
```

deriveFeatureInvertedFeature

[no documentation]

```
invertedFeature = invertedFeatureInverting.featureInverted
```

checkFeatureSpecialization

A Feature must directly or indirectly specialize *`Base::things`* from the Kernel Library.

```
allSupertypes()->includes(resolve("Base::things"))
```

deriveFeatureInverseFeature

[no documentation]

```
inverseFeature = invertingFeatureInverting.featureInverse
```

validateFeatureChainingFeaturesNotSelf

A Feature cannot be one of its own `chainingFeatures`.

```
chainingFeatures->excludes(self)
```

checkFeatureDataValueSpecialization

If a Feature has an `ownedTyping` relationship to a DataType, then it must directly or indirectly specialize *`Base::dataValues`* from the Kernel Semantics Library.

```
ownedTyping.type->exists(selectByKind(DataType)) implies
    allSupertypes()->includes(resolve("Base::dataValues"))
```

checkFeatureResultSpecialization

[no documentation]

checkFeatureEndSpecialization

[no documentation]

deriveFeatureOwnedFeatureChaining

The `ownedFeatureChainings` of this Feature are the `ownedRelationships` that are FeatureChainings.

```
ownedFeatureChaining = ownedRelationship->selectByKind(FeatureChaining)
```

deriveFeatureChainingFeature

The `chainingFeatures` of a Feature are the `chainingFeatures` of its `ownedFeatureChainings`.

```
chainingFeature = ownedFeatureChaining.chainingFeature
```

checkFeatureItemFlowRedefinition

[no documentation]

8.3.3.3.4 FeatureChaining

Description

FeatureChaining is a Relationship that makes its target Feature one of the `chainingFeatures` of its owning Feature.

General Classes

Relationship

Attributes

chainingFeature : Feature {redefines target}

The Feature whose values partly determine values of `featureChained`, as described in `Feature::chainingFeature`.

/featureChained : Feature {subsets owningRelatedElement, redefines source}

The Feature whose values are partly determined by values of the `chainingFeature`, as described in `Feature::chainingFeature`.

Operations

No operations.

Constraints

None.

8.3.3.3.5 FeatureInverting

Description

A FeatureInverting is a Relationship between Features asserting that their interpretations (sequences) are the reverse of each other, identified as `featureInverted` and `invertingFeature`. For example, a Feature identifying each person's parents is the inverse of a Feature identifying each person's children. A person identified as a parent of another will identify that other as one of their children.

General Classes

Relationship

Attributes

featureInverted : Feature {redefines source}

Feature that is an the inverse of `invertingFeature`.

invertingFeature : Feature {redefines target}

Feature that is an inverse of `invertedFeature`.

/owningFeature : Feature [0..1] {subsets owningRelatedElement, featureInverted}

A `featureInverted` that is also an `owningRelatedElement`.

Operations

No operations.

Constraints

None.

8.3.3.3.6 FeatureTyping

Description

FeatureTyping is Specialization in which the `specific` Type is a Feature. This means the set of instances of the (specific) `typedFeature` is a subset of the set of instances of the (general) `type`. In the simplest case, the `type` is a Classifier, whereupon the `typedFeature` subset has instances interpreted as sequences ending in things (in the modeled universe) that are instances of the Classifier.

General Classes

Specialization

Attributes

/owningFeature : Feature [0..1] {subsets typedFeature, redefines owningType}

The Feature that owns this FeatureTyping (which must also be the `typedFeature`).

type : Type {redefines general}

The Type that is being applied by this FeatureTyping.

typedFeature : Feature {redefines specific}

The Feature that has its Type determined by this FeatureTyping.

Operations

No operations.

Constraints

None.

8.3.3.3.7 Featuring

Description

Featuring is a Relationship between a Type and a Feature that is featured by that Type. Every instance in the domain of the `feature` must be classified by the `type`. This means that sequences that are classified by the `feature` must have a prefix subsequence that is classified by the `type`.

Featuring is abstract and does not commit to which of `feature` or `type` are the source or target. This commitment is made in the subclasses of Featuring, TypeFeaturing and FeatureMembership, which are directed differently.

General Classes

Relationship

Attributes

feature : Feature {subsets relatedElement}

The Feature that is featured by the `featuringType`.

type : Type {subsets relatedElement}

The Type that features the `featureOfType`.

Operations

No operations.

Constraints

None.

8.3.3.3.8 Redefinition

Description

Redefinition specializes Subsetting to require the `redefinedFeature` and the `redefiningFeature` to have the same values (on each instance of the domain of the `redefiningFeature`). This means any restrictions on the `redefiningFeature`, such as `type` or `multiplicity`, also apply to the `redefinedFeature` (on each instance of the `owningType` of the redefining Feature), and vice versa. The `redefinedFeature` might have values for instances of the `owningType` of the `redefiningFeature`, but only as instances of the `owningType` of the `redefinedFeature` that happen to also be instances of the `owningType` of the `redefiningFeature`. This is supported by the constraints inherited from Subsetting on the domains of the `redefiningFeature` and `redefinedFeature`. However, these constraints are narrowed for Redefinition to require the `owningTypes` of the `redefiningFeature` and `redefinedFeature` to be different and the `redefinedFeature` to not be imported into the `owningNamespace` of the `redefiningFeature`. This enables the `redefiningFeature` to have the same name as the `redefinedFeature` if desired.

General Classes

Subsetting

Attributes

redefinedFeature : Feature {redefines subsettedFeature}

The Feature that is redefined by the `redefiningFeature` of this Redefinition.

redefiningFeature : Feature {redefines subsettingFeature}

The Feature that is redefining the `redefinedFeature` of this Redefinition.

Operations

No operations.

Constraints

None.

8.3.3.3.9 Subsetting

Description

Subsetting is Generalization in which the `specific` and `general` Types that are Features. This means all values of the `subsettingFeature` (on instances of its domain, i.e., the intersection of its `featuringTypes`) are values of the `subsettedFeature` on instances of its domain. To support this, the domain of the `subsettingFeature` must be the same or specialize (at least indirectly) the domain of the `subsettedFeature` (via Generalization), and the range (intersection of a Feature's `types`) of the `subsettingFeature` must specialize the range of the `subsettedFeature`. The `subsettedFeature` is imported into the `owningNamespace` of the `subsettingFeature` (if it is not already in that namespace), requiring the names of the `subsettingFeature` and `subsettedFeature` to be different.

General Classes

Specialization

Attributes

/owningFeature : Feature {subsets subsettingFeature, redefines owningType}

The Feature that owns this Subsetting relationship, which must also be its `subsettingFeature`.

subsettedFeature : Feature {redefines general}

The Feature that is subsetted by the `subsettingFeature` of this Subsetting.

subsettingFeature : Feature {redefines specific}

The Feature that is a subset of the `subsettedFeature` of this Subsetting.

Operations

No operations.

Constraints

None.

8.3.3.3.10 TypeFeaturing

Description

A TypeFeaturing is a Featuring Relationship in which the `featureOfType` is the `source` and the `featuringType` is the target. A TypeFeaturing may be owned by its `featureOfType`.

General Classes

Featuring

Attributes

featureOfType : Feature {redefines source, feature}

The Feature that is featured by the `featuringType`. It is the `source` of the Relationship.

featuringType : Type {redefines target, type}

The Type that features the `featureOfType`. It is the `target` of the Relationship.

/owningFeatureOfType : Feature [0..1] {subsets featureOfType, owningRelatedElement}

The Feature that owns this TypeFeaturing and is also the `featureOfType`.

Operations

No operations.

Constraints

None.

8.3.4 Kernel Abstract Syntax

8.3.4.1 Data Types Abstract Syntax

8.3.4.1.1 Overview

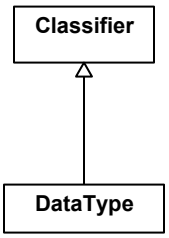

Figure 20. Data Types

8.3.4.1.2 DataType

Description

A DataType is a Classifier of things (in the universe) that can only be distinguished by how they are related to other things (via Features). This means multiple things classified by the same DataType

- Cannot be distinguished when they are related to other things in exactly the same way, even when they are intended to be about different things.

- Can be distinguished when they are related to other things in different ways, even when they are intended to be about the same thing.

General Classes

Classifier

Attributes

None.

Operations

No operations.

Constraints

checkDataTypeSpecialization

A DataType must directly or indirectly specialize the base DataType *`Base::DataValue`* from the Kernel Semantic Library.

```
allSupertypes()->includes(resolve("Base::DataValue"))
```

validateDatatypeSpecialization

A `DataType` must not specialize a `Class` or an `Association`.

```
ownedGeneralization.general->
    forAll(not oclIsKindOf(Class))
```

8.3.4.2 Classes Abstract Syntax

8.3.4.2.1 Overview

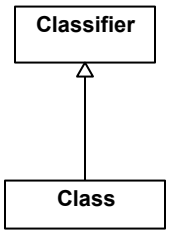

Figure 21. Classes

8.3.4.2.2 Class

Description

A Class is a Classifier of things (in the universe) that can be distinguished without regard to how they are related to other things (via Features). This means multiple things classified by the same Class can be distinguished, even when they are related other things in exactly the same way.

General Classes

Classifier

Attributes

None.

Operations

No operations.

Constraints

validateClassSpecialization

A `Class` must not specialize a `DataType`.

```
ownedGeneralization.general->
    forAll(not oclIsKindOf(DataType) and
           not oclIsKindOf(Association))
```

checkClassSpecialization

A Class must directly or indirectly specialize the base Class *`Occurrences::Occurrence`* from the Kernel Semantic Library.

```
allSupertypes()->includes(resolve("Occurrences::Occurrence"))
```

8.3.4.3 Structures Abstract Syntax

8.3.4.3.1 Overview

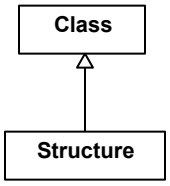

Figure 22. Structures

8.3.4.3.2 Structure

Description

A Structure is a Class of objects in the modeled universe that are primarily structural in nature. While an Object is not itself behavioral, it may be involved in and acted on by Behaviors, and it may be the performer of some of them.

General Classes

Class

Attributes

None.

Operations

No operations.

Constraints

checkStructureSpecialization

A Structure must directly or indirectly specialize the base Structure *Objects::Object* from the Kernel Semantic Library.

```
allSupertypes()->includes(resolve("Objects::Object"))
```

8.3.4.4 Associations Abstract Syntax

8.3.4.4.1 Overview

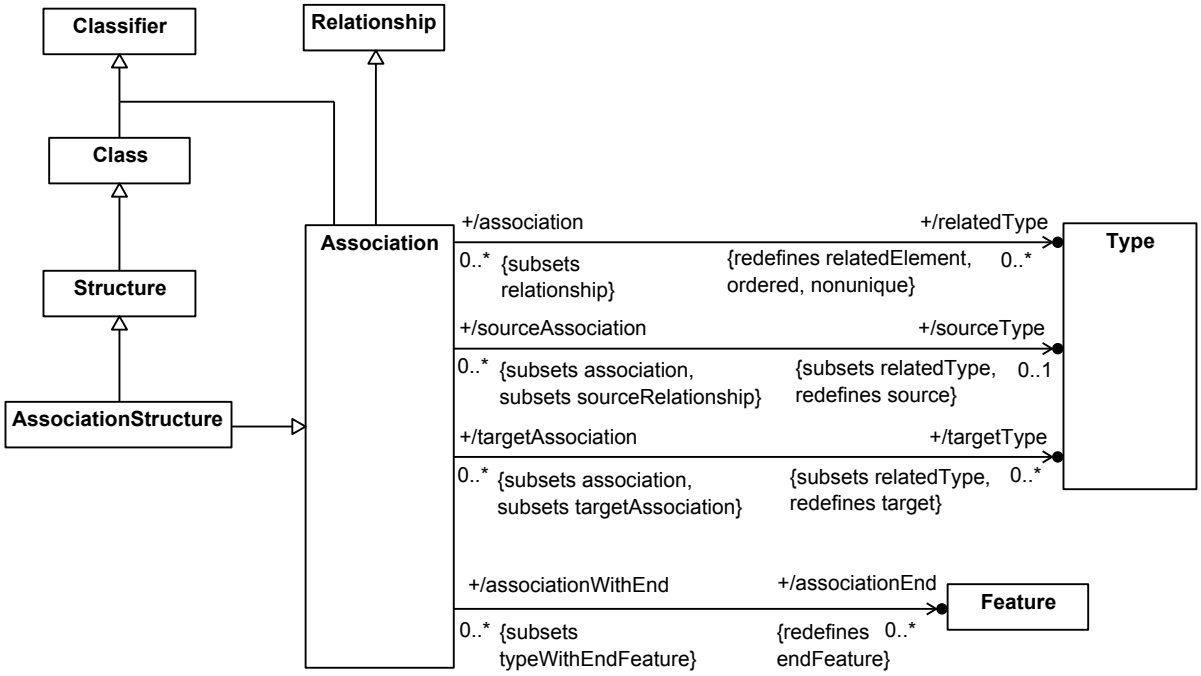

Figure 23. Associations

8.3.4.4.2 Association

Description

An Association is a Relationship and a Classifier to enable classification of links between things (in the universe). The co-domains (`types`) of the `associationEnd` Features are the `relatedTypes`, as co-domain and participants (linked things) of an Association identify each other.

General Classes

Relationship
Classifier

Attributes

/associationEnd : Feature [0..*] {redefines endFeature}

The `features` of the Association that identify the things that can be related by it. A concrete Association must have at least two `associationEnds`. When it has exactly two, the Association is called a *binary* Association.

/relatedType : Type [0..*] {redefines relatedElement, ordered, nonunique}

The `types` of the `associationEnds` of the Association, which are the `relatedElements` of the Association considered as a Relationship.

/sourceType : Type [0..1] {subsets relatedType, redefines source}

The source `relatedType` for this Association. It is the first `relatedType` of the Association.

/targetType : Type [0..*] {subsets relatedType, redefines target}

The target `relatedTypes` for this Association. This includes all the `relatedTypes` other than the `sourceType`.

Operations

No operations.

Constraints

checkAssociationSpecialization

[no documentation]

```
allSupertypes()->includes(resolve("Links::Link"))
```

checkAssociationBinarySpecialization

[no documentation]

```
endFeatures()->size() = 2 implies
    allSupertypes()->includes(resolve("Links::Link))
```

validateAssociationRelatedTypes

If an Association is concrete (not abstract), then it must have at least two `relatedTypes`.

```
not isAbstract implies relatedType->size() >= 2
```

validateAssociationStructureIntersection

[no documentation]

```
oclIsKindOf(Structure) = oclIsKindOf(AssociationStructure)
```

deriveAssociationRelatedType

[no documentation]

```
relatedTypes = associationEnd.type
```

8.3.4.4.3 AssociationStructure

Description

General Classes

Structure
Association

Attributes

None.

Operations

No operations.

Constraints

checkAssociationStructureSpecialization

[no documentation]

```
allSupertypes()->includes(resolve("Objects::ObjectLink"))
```

checkAssociationStructureBinarySpecialization

[no documentation]

```
endFeature->size() = 2 implies
    allSupertypes()->includes(resolve("Objects::BinaryLinkObject"))
```

8.3.4.5 Connectors Abstract Syntax

8.3.4.5.1 Overview

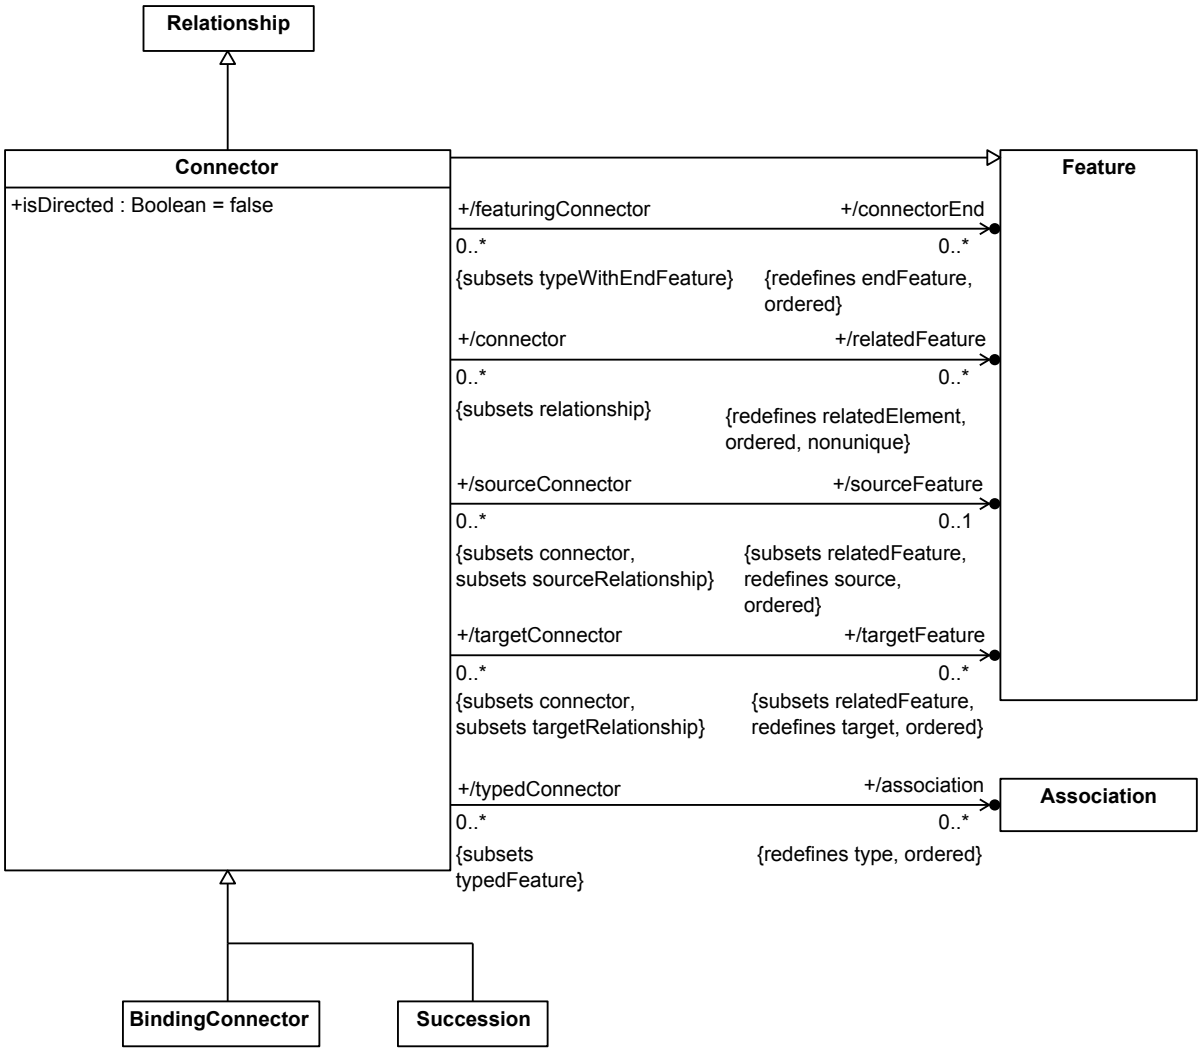

Figure 24. Connectors

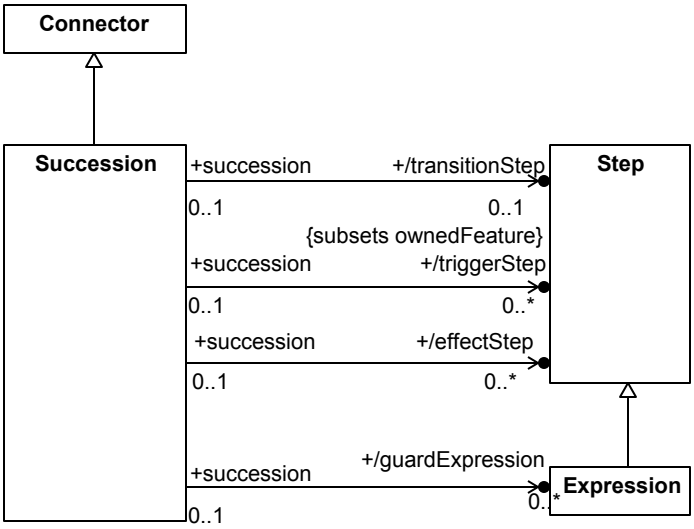

Figure 25. Successions

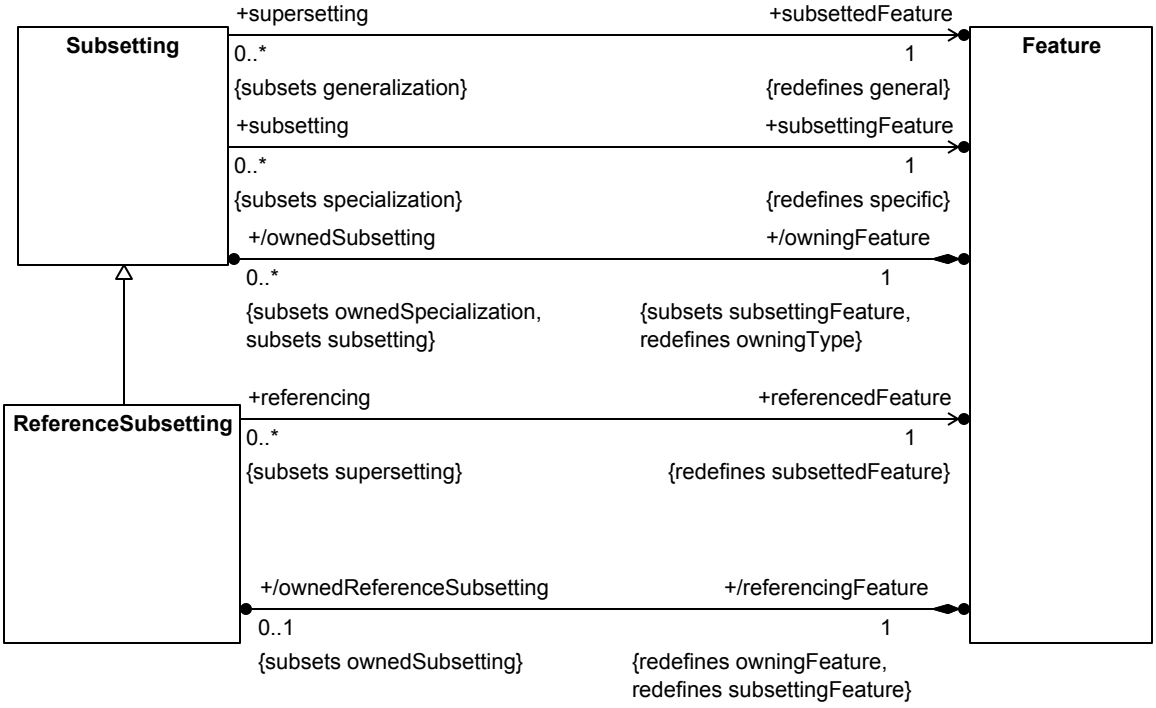

Figure 26. Reference Subsetting

8.3.4.5.2 Binding Connector

Description

A Binding Connector is a binary Connector that requires its `relatedFeatures` to identify the same things (have the same values).

A BindingConnector must be directly or indirectly typed by the *SelfLink* Association from the *Links library model. Both end multiplicities must be 1..1 when the relatedFeatures have unique values.*

General Classes

Connector

Attributes

None.

Operations

No operations.

Constraints

checkBindingConnectorInitiialTypeFeaturing

[no documentation]

checkBindingConnectorSpecialization

[no documentation]

8.3.4.5.3 Connector

Description

A Connector is a usage of Associations, with links restricted to instances of the Type in which it is used (domain of the Connector). Associations restrict what kinds of things might be linked. The Connector further restricts these links to between values of two Features on instances of its domain.

General Classes

Relationship
Feature

Attributes

/association : Association [0..*] {redefines type, ordered}

The Associations that type the Connector.

/connectorEnd : Feature [0..*] {redefines endFeature, ordered}

The `endFeatures` of a Connector, which redefine the `endFeatures of the associations of the Connector. The connectorEnds determine via ReferenceSubsetting Relationships which Features are related by the Connector.`

isDirected : Boolean

For a binary Connector, whether or not the Connector should be considered to have a direction from `source` to `target`.

/relatedFeature : Feature [0..*] {redefines relatedElement, ordered, nonunique}

The Features that are related by this Connector considered as a Relationship, derived as the referenced Features of the `connectorEnds` of the Connector.

/sourceFeature : Feature [0..1] {subsets relatedFeature, redefines source, ordered}

The source `relatedFeature` for this Connector. It is derived as the first `relatedFeature`.

/targetFeature : Feature [0..*] {subsets relatedFeature, redefines target, ordered}

The target `relatedFeatures` for this Connector. This includes all the `relatedFeatures` other than the `sourceFeature`.

Operations

No operations.

Constraints

checkConnectorObjectSpecialization

[no documentation]

checkConnectorBinarySpecialization

[no documentation]

deriveConnectorTargetFeature

The `targetFeatures` of a Connector are the `relatedFeatures` other than the `sourceFeature`.

```
targetFeature =
    if sourceFeature = null then relatedFeature
    else relatedFeature->excluding(sourceFeature)
    endif
```

deriveConnectorConnectorEnd

The `connectorEnds` of a Connector are its `endFeatures`.

```
connectorEnd = feature->select(isEnd)
```

deriveConnectorRelatedFeature

The `relatedFeatures` of a Connector are the referenced Features of its `connectorEnds`.

```
relatedFeature = connectorEnd.ownedReferenceSubsetting.subsettedFeature
```

checkConnectorTypeFeaturing

Each `relatedFeature` of a Connector must have some `featuringType` of the Connector as a direct or indirect `featuringType` (where a Feature with no `featuringType` is treated as if the Classifier *Base::Anything* was its `featuringType`).

```
relatedFeature->forAll(f |
    if featuringType->isEmpty() then f.isFeaturedWithin(null)
    else featuringType->exists(t | f.isFeaturedWithin(t))
    endif)
```

checkConnectorSpecialization

[no documentation]

deriveConnectorSourceFeature

If this is a binary Connector, then the `sourceFeature` is the first `relatedFeature`. If this Connector is not binary, then it has no `sourceFeature`.

```
sourceFeature =
    if relatedFeature->size() = 2 then relatedFeature->at(1)
    else null
    endif
```

validateConnectorRelatedFeatures

If a Connector is concrete (not abstract), then it must have at least two `relatedFeatures`.

```
not isAbstract implies relatedFeature->size() >= 2
```

checkConnectorBinaryObjectSpecialization

[no documentation]

8.3.4.5.4 ReferenceSubsetting

Description

ReferenceSubsetting is a kind of Subsetting in which the `referencedFeature` is syntactically distinguished from other Features subsetted by the `referencingFeature`. ReferenceSubsetting has the same semantics as Subsetting, but the `referenceFeature` may have a special purpose relative to the `referencingFeature`. For instance, ReferenceSubsetting is used to identify the `relatedFeatures` of a Connector.

ReferenceSubsetting is always an `ownedRelationship` of its `referencingFeature`. A Feature can have at most one `ownedReferenceSubsetting`.

General Classes

Subsetting

Attributes

referencedFeature : Feature {redefines subsettedFeature}

The Feature that is referenced by the `referencingFeature` of this ReferenceSubsetting.

/referencingFeature : Feature {redefines subsettingFeature, owningFeature}

The Feature that owns this ReferenceSubsetting relationship, which is also its `subsettingFeature`.

Operations

No operations.

Constraints

None.

8.3.4.5.5 Succession

Description

A Succession is a binary Connector that requires its `relatedFeatures` to happen separately in time. A Succession must be typed by the Association *HappensBefore* from the Kernel Model Library (or a specialization of it).

General Classes

Connector

Attributes

/effectStep : Step [0..*]

Steps that represent occurrences that are side effects of the `transitionStep` occurring.

/guardExpression : Expression [0..*]

Expressions that must evaluate to true before the `transitionStep` can occur.

/transitionStep : Step [0..1] {subsets ownedFeature}

A Step that is typed by the Behavior *TransitionPerformance* (from the Model Library) that has this Succession as its *`transitionLink`*.

/triggerStep : Step [0..*]

Steps that map incoming events to the timing of occurrences of the `transitionStep`. The values of `triggerStep` subset the list of acceptable events to be received by a Behavior or the object that performs it.

Operations

No operations.

Constraints

checkSuccessionSpecialization

[no documentation]

8.3.4.6 Behaviors Abstract Syntax

8.3.4.6.1 Overview

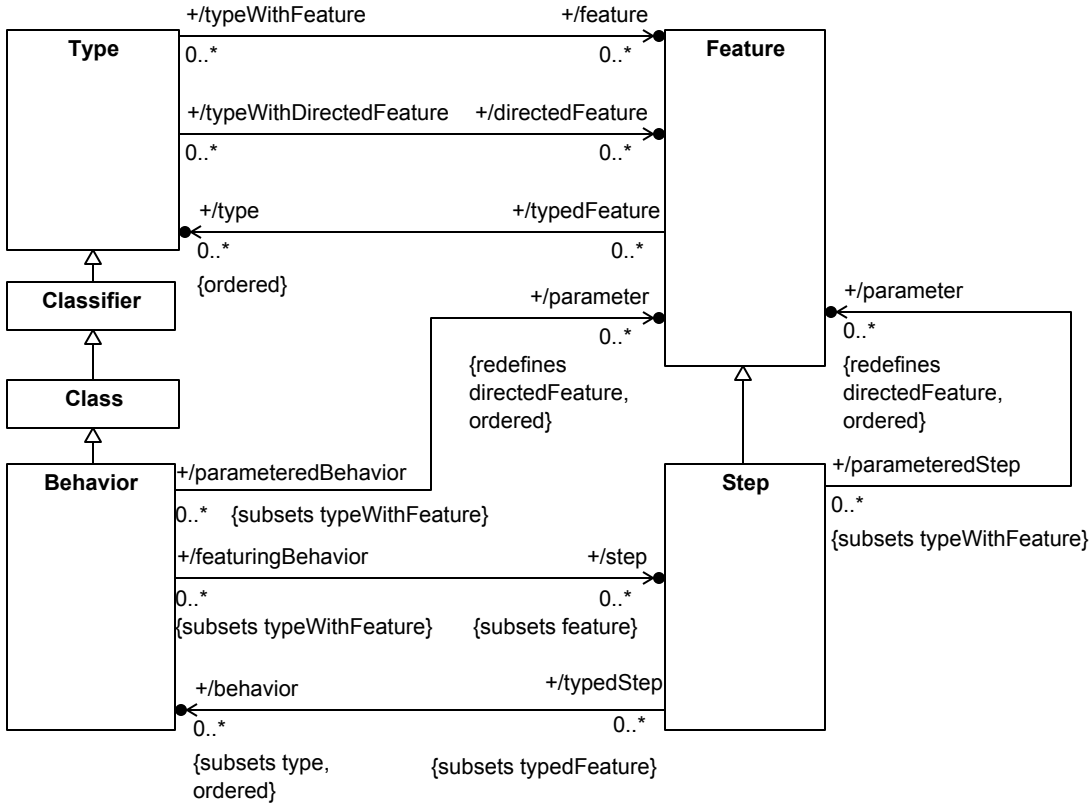

Figure 27. Behaviors

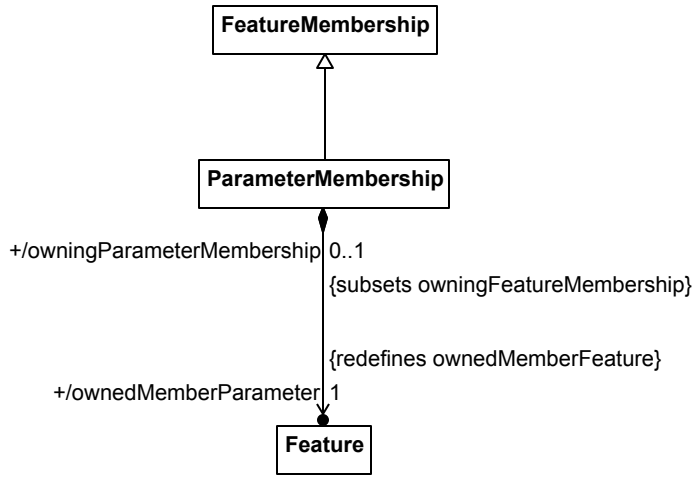

Figure 28. Parameter Memberships

8.3.4.6.2 Behavior

Description

A Behavior coordinates occurrences of other Behaviors, as well as changes in objects. Behaviors can be decomposed into Steps and be characterized by `parameters`.

General Classes

Class

Attributes

/parameter : Feature [0..*] {redefines directedFeature, ordered}

The parameters of this Behavior, which are all its `directedFeatures`, whose values are passed into and/or out of a performance of the Behavior.

/step : Step [0..*] {subsets feature}

The Steps that make up this Behavior.

Operations

No operations.

Constraints

checkBehaviorSpecialization

[no documentation]

```
allSupertypes()->includes(resolve("Performances::Performance"))
```

8.3.4.6.3 Step

Description

A Step is a Feature that is typed by one or more Behaviors. Steps may be used by one Behavior to coordinate the performance of other Behaviors, supporting the steady refinement of behavioral descriptions. Steps can be ordered in time and can be connected using ItemFlows to specify things flowing between their parameters.

General Classes

Feature

Attributes

/behavior : Behavior [0..*] {subsets type, ordered}

The Behaviors that type this Step.

/parameter : Feature [0..*] {redefines directedFeature, ordered}

The parameters of this Expression, which are all its `directedFeatures`, whose values are passed into and/or out of a performance of the Behavior.

Operations

No operations.

Constraints

checkStepSubperformanceSpecialization

[no documentation]

checkStepOwnedPerformanceSpecialization

checkStepEnclosedPerformance Specialization

[no documentation]

8.3.4.6.4 ParameterMembership

Description

A ParameterMembership is a FeatureMembership that identifies its `memberFeature` as a parameter, which is always owned, and must have a `direction`. A ParameterMembership must be owned by a Behavior or a Step.

General Classes

FeatureMembership

Attributes

/ownedMemberParameter : Feature {redefines ownedMemberFeature}

The Feature that is identified as a parameter by this ParameterMembership, which is always owned by the ParameterMembership.

Operations

No operations.

Constraints

None.

8.3.4.7 Functions Abstract Syntax

8.3.4.7.1 Overview

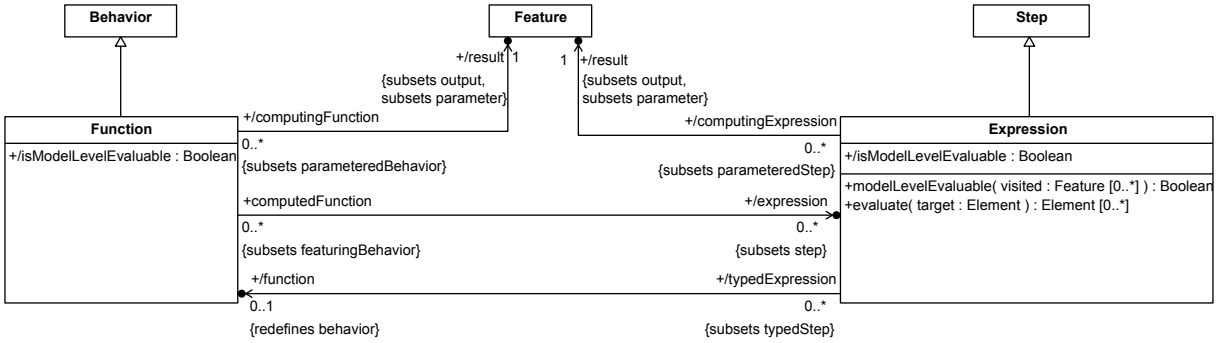

Figure 29. Functions

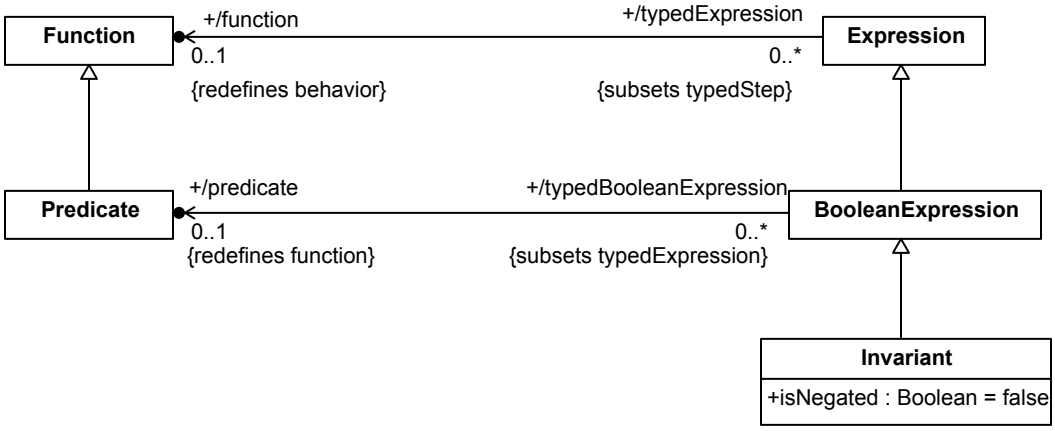

Figure 30. Predicates

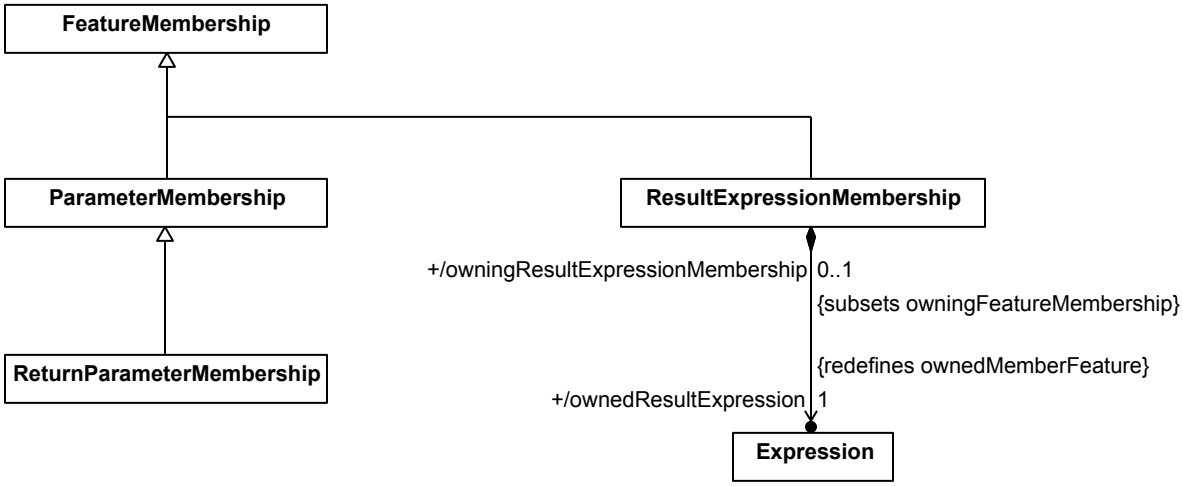

Figure 31. Function Memberships

8.3.4.7.2 BooleanExpression

Description

A BooleanExpression is a Boolean-valued Expression whose type is a Predicate. It represents a logical condition resulting from the evaluation of the Predicate.

A BooleanExpression must subset, directly or indirectly, the Expression *booleanEvaluations* from the Base model library, which is typed by the base Predicate *BooleanEvaluation*. As a result, a BooleanExpression must always be typed by BooleanEvaluation or a subclass of BooleanEvaluation.

General Classes

Expression

Attributes

/predicate : Predicate [0..1] {redefines function}

The Predicate that types the Expression.

Operations

No operations.

Constraints

checkBooleanExpressionSpecialization

[no documentation]

8.3.4.7.3 Expression

Description

An Expression is a Step that is typed by a Function. An Expression that also has a Function as its `featuringType` is a computational step within that Function. An Expression always has a single `result` parameter, which redefines the `result` parameter of its defining `function`. This allows Expressions to be interconnected in tree structures, in which inputs to each Expression in the tree are determined as the results of other Expressions in the tree.

General Classes

Step

Attributes

/function : Function [0..1] {redefines behavior}

The Function that types this Expression.

/isModelLevelEvaluable : Boolean

Whether this Expression meets the constraints necessary to be evaluated at *model level*, that is, using metadata within the model.

/result : Feature {subsets parameter, output}

The `result` parameter of the Expression, derived as the single `parameter` of the Expression with direction `out`. The result of an Expression must either be inherited from its `function` or (directly or indirectly) redefine the `result` parameter of its `function`.

Operations

evaluate(target : Element) : Element [0..*]

If this Expression `isModelLevelEvaluable`, then evaluate it using the `target` as the context Element for resolving Feature names and testing classification. The result is a collection of Elements, each of which must be a LiteralExpression or a Feature that is not an Expression.

pre: `isModelLevelEvaluable`

body:

modelLevelEvaluable(visited : Feature [0..*]) : Boolean

>p>Return whether this Expression is model-level evaluable. The `visited` parameter is used to track possible circular feature references. Such circular references are not allowed in model-level evaluable expressions.

An Expression that is not otherwise specialized is model-level evaluable if all of its `features` are either `in` parameters, its single `resultParameter` or a result Expression owned via a ResultExpressionMembership (and possibly its implicit BindingConnector). The `parameters` parameters must not have and `ownedFeatures` and the result Expression must be model-level evaluable.

```
body: parameters->forAll(
    p | directionOf(p) = FeatureDirectionKind::_'in' and
    p.valuation = null) and
ownedFeatureMembership->
    select(oclIsKindOf(ResultExpressionMembership))->
    forAll(resultExpression.modelLevelEvaluable(visited))
```

Constraints

deriveExpressionIsModelLevelEvaluable

Whether an Expression `isModelLevelEvaluable` is determined by the `modelLevelEvaluable()` operation.

```
isModelLevelEvaluable = modelLevelEvaluable(Set(Element){})
```

checkExpressionTypeFeaturing

The `value` Expression must have the same `featuringTypes` as the `featureWithValue`.

```
value.featuringType = featureWithValue.featuringType
```

checkExpressionResultBindingConnector

[no documentation]

checkExpressionSpecialization

[no documentation]

8.3.4.7.4 Function

Description

A Function is a Behavior that has a single `out parameter` that is identified as its `result`. Any other `parameters` of a Function than the `result` must have direction `in`. A Function represents the performance of a calculation that produces the values of its `result` parameter. This calculation may be decomposed into Expressions that are `steps` of the Function.

General Classes

Behavior

Attributes

/expression : Expression [0..*] {subsets step}

The Expressions that are steps in the calculation of the `result` of this Function.

/isModelLevelEvaluable : Boolean

Whether this Function can be used as the `function` of a model-level evaluable InvocationExpression.

/result : Feature {subsets parameter, output}

The `result` parameter of the Function, derived as the single `parameter` of the Function with direction `out`.

Operations

No operations.

Constraints

checkFunctionsSpecialization

[no documentation]

checkFunctionResult BindingConnector

[no documentation]

8.3.4.7.5 Invariant

Description

An Invariant is a BooleanExpression that is asserted to have a specific Boolean result value. If `isNegated = false`, then the Invariant must subset, directly or indirectly, the BooleanExpression *trueEvaluations* from the Kernel library, meaning that the result is asserted to be true. If `isNegated = true`, then the Invariant must subset, directly or indirectly, the BooleanExpression *falseEvaluations* from the Kernel library, meaning that the result is asserted to be false.

General Classes

BooleanExpression

Attributes

isNegated : Boolean

Whether this Invariant is asserted to be false rather than true.

Operations

No operations.

Constraints

checkInvariantSpecialization

[no documentation]

8.3.4.7.6 Predicate

Description

A Predicate is a Function whose `result` Parameter has type *Boolean* and multiplicity 1..1.

General Classes

Function

Attributes

None.

Operations

No operations.

Constraints

checkPredicateSpecialization

[no documentation]

8.3.4.7.7 ResultExpressionMembership

Description

A ResultExpressionMembership is a FeatureMembership that indicates that the `ownedResultExpression` provides the result values for the Function or Expression that owns it. The owning Function or Expression must contain a BindingConnector between the `result` parameter of the `ownedResultExpression` and the `result` parameter of the Function or Expression.

General Classes

FeatureMembership

Attributes

/ownedResultExpression : Expression {redefines ownedMemberFeature}

The Expression that provides the result for the owner of the ResultExpressionMembership.

Operations

No operations.

Constraints

None.

8.3.4.7.8 ReturnParameterMembership

Description

A ReturnParameterMembership is a ParameterMembership that indicates that the `memberParameter` is the `result` parameter of a Function or Expression. The `direction` of the `memberParameter` must be `out`.

General Classes

ParameterMembership

Attributes

None.

Operations

No operations.

Constraints

None.

8.3.4.8 Expressions Abstract Syntax

8.3.4.8.1 Overview

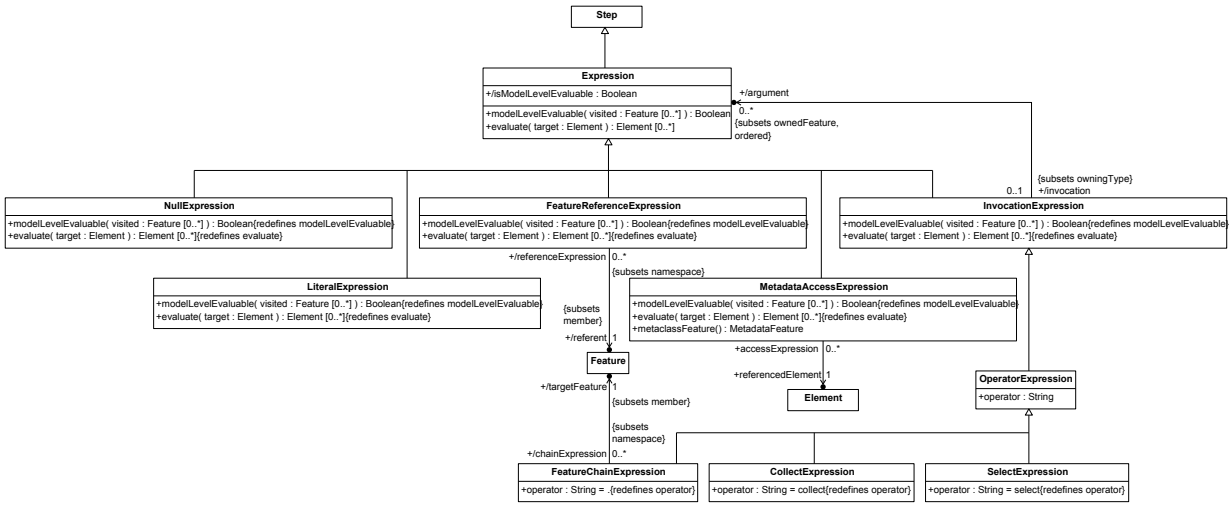

Figure 32. Expressions

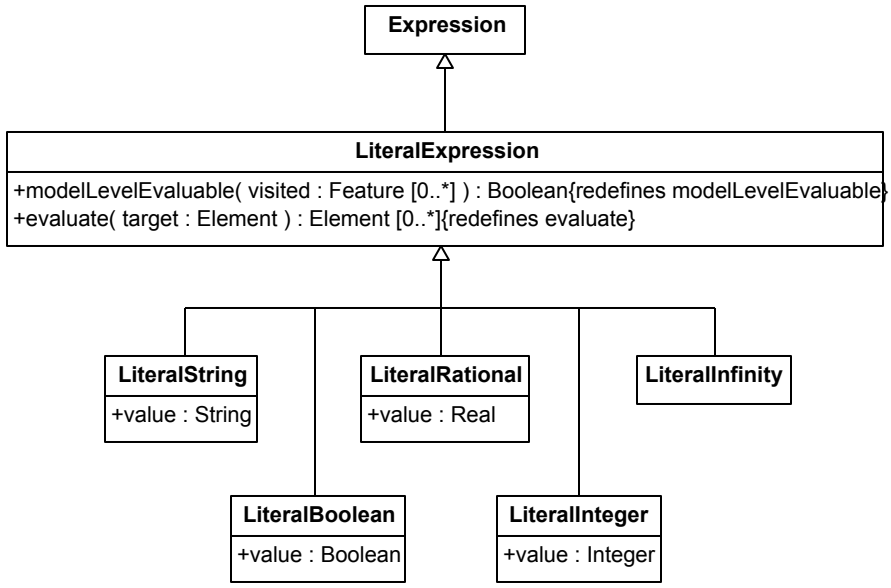

Figure 33. Literal Expressions

8.3.4.8.2 CollectExpression

Description

A CollectExpression is an OperatorExpression whose operator is `"collect"`, which resolves to the library Function *`ControlFunctions::collect`*.

General Classes

OperatorExpression

Attributes

operator : String {redefines operator}

Operations

No operations.

Constraints

None.

8.3.4.8.3 FeatureChainExpression

Description

A FeatureChainExpression is an OperatorExpression whose operator is `"."`, which resolves to the library Function *`ControlFunctions::'.'`*. It evaluates to the result of chaining the `result` Feature of its single `argument` Expression with its `targetFeature`.

The first two `members` of a FeatureChainExpression must be its single `argument` Expression and its `targetFeature`. Its only other `members` shall be those necessary to complete it as an InvocationExpression.

General Classes

OperatorExpression

Attributes

operator : String {redefines operator}

/targetFeature : Feature {subsets member}

The Feature that is accessed by this FeatureChainExpression, derived as its second `member` Feature (the first being its one `argument` Expression). This Feature must redefine the *`target` Feature of the Function `ControlFunctions::'.'`*.

Operations

No operations.

Constraints

None.

8.3.4.8.4 FeatureReferenceExpression

Description

A FeatureReferenceExpression is an Expression whose `result` is bound a `referent` Feature. The only `members` allowed for a FeatureReferenceExpression are the `referent`, the `result` and the BindingConnector between them.

General Classes

Expression

Attributes

/referent : Feature {subsets member}

The Feature that is referenced by this FeatureReferenceExpression, derived as its first `member` Feature.

Operations

evaluate(target : Element) : Element [0..*]

First, determine a value Expression for the `referent`:

- If the `target` Element is a Type that has a `feature` that is the `referent` or (directly or indirectly) redefines it, then the `value` Expression of the FeatureValue for that `feature` (if any).
- Else, if the `referent` has no `featuringTypes`, the `value` Expression of the FeatureValue for the `referent` (if any).

Then:

- If such a value Expression exists, return the result of evaluating that Expression on the `target`.
- Else, if the `referent` is not an Expression, return the `referent`.
- Else return the empty sequence.

```
body: if not target.oclIsKindOf(Type) then Sequence{}
else
    let feature: Sequence(Feature) =
        target.oclAsType(Type).feature->select(f |
            f.ownedRedefinition.redefinedFeature->
                includes(referent)) in
        if feature->notEmpty() then
            feature.valuation.value.evaluate(target)
        else if referent.featuringType->isEmpty()
            then referent
        else Sequence{}
        endif endif
endif
```

modelLevelEvaluable(visited : Feature [0..*]) : Boolean

A FeatureReferenceExpression is model-level evaluable if it's `referent`

- conforms to the self-reference feature *`Anything::self`*;
- is an Expression that is model-level evaluable;
- has an owningType that is a Metaclass or MetadataFeature; or
- has no featuringTypes and, if it has a FeatureValue, the value Expression is model-level evaluable.

```
body: referent.conformsTo("Anything::self") or
visited->excludes(referent) and
(referent.oclIsKindOf(Expression) and
    referent.oclAsType(Expression).modelLevelEvaluable(visited->including(referent)) or
referent.owningType <> null and
    (referent.owningType.isOclKindOf(MetaClass) or
    referent.owningType.isOclKindOf(MetadataFeature)) or
referent.featuringType->isEmpty() and
    (referent.valuation = null or
    referent.valuation.modelLevelEvaluable(visited->including(referent))))
```

Constraints

None.

8.3.4.8.5 InvocationExpression

Description

An InvocationExpression is an Expression each of whose input `parameters` are bound to the `result` of an owned `argument` Expression. Each input `parameter` may be bound to the `result` of at most one `argument`.

General Classes

Expression

Attributes

/argument : Expression [0..*] {subsets ownedFeature, ordered}

The `value` `Expressions` of the `FeatureValues` of the input `parameters` of the `InvocationExpression`.

Operations

evaluate(target : Element) : Element [0..*]

Apply the Function that is the `type` of this InvocationExpression to the argument values resulting from evaluating each of the `argument` Expressions on the given `target`. If the application is not possible, then return an empty sequence.

modelLevelEvaluable(visited : Feature [0..*]) : Boolean

An InvocationExpression is model-level evaluable if all its `argument` Expressions are model-level evaluable and its `function` is model-level evaluable.

```
body: argument->forAll(modelLevelEvaluable(visited)) and
    function.isModelLevelEvaluable
```

Constraints

None.

8.3.4.8.6 LiteralBoolean

Description

LiteralBoolean is a LiteralExpression that provides a *`Boolean`* value as a result. Its `result` parameter must have type *`Boolean`*.

General Classes

LiteralExpression

Attributes

value : Boolean

The Boolean value that is the result of evaluating this Expression.

Operations

No operations.

Constraints

None.

8.3.4.8.7 LiteralExpression

Description

A LiteralExpression is an Expression that provides a basic value as a result. It must directly or indirectly specialize the Function *LiteralEvaluation* from the *Base* model library, which has no parameters other than its result, which is a single *DataValue*.

General Classes

Expression

Attributes

None.

Operations

evaluate(target : Element) : Element [0..*]

The model-level value of a LiteralExpression is itself.

body: `Sequence{self}`

modelLevelEvaluable(visited : Feature [0..*]) : Boolean

A LiteralExpression is always model-level evaluable.

body: `true`

Constraints

deriveLiteralExpressionIsModelLevelEvaluable

A LiteralExpression is always model-level evaluable.

```
isModelLevelEvaluable = true
```

8.3.4.8.8 LiteralInfinity

Description

A LiteralInfinity is a LiteralExpression that provides the positive infinity value (`*`). It's `result` must have the type *Positive*.

General Classes

LiteralExpression

Attributes

None.

Operations

No operations.

Constraints

None.

8.3.4.8.9 LiteralInteger

Description

A LiteralInteger is a LiteralExpression that provides an *`Integer`* value as a result. Its `result` parameter must have the type *`Integer`*.

General Classes

LiteralExpression

Attributes

value : Integer

The Integer value that is the result of evaluating this Expression.

Operations

No operations.

Constraints

None.

8.3.4.8.10 LiteralRational

Description

A LiteralRational is a LiteralExpression that provides a *`Rational`* value as a result. Its `result` parameter must have the type *`Rational`*.

General Classes

LiteralExpression

Attributes

value : Real

The value whose rational approximation is the result of evaluating this Expression.

Operations

No operations.

Constraints

None.

8.3.4.8.11 LiteralString

Description

A LiteralString is a LiteralExpression that provides a *`String`* value as a result. Its `result` parameter must have the type *`String`*.

General Classes

LiteralExpression

Attributes

value : String

The String value that is the result of evaluating this Expression.

Operations

No operations.

Constraints

None.

8.3.4.8.12 MetadataAccessExpression

Description

A MetadataAccessExpression is an Expression whose `result` is a sequence of instances of Metaclasses representing all the MetadataFeature annotations of the `referencedElement`. In addition, the sequence includes an instance of the reflective Metaclass corresponding to the MOF class of the `referencedElement`, with values for all the abstract syntax properties of the Element.

General Classes

Expression

Attributes

referencedElement : Element

The Element whose metadata is being accessed.

Operations

evaluate(target : Element) : Element [0..*]

Return the `ownedElements` of the `referencedFeature` that are MetadataFeatures and have the `referencedElement` as an `annotatedElement`, plus a MetadataFeature whose `annotatedElement` is the `referencedElement`, whose `metaclass` is the reflective Metaclass corresponding to the MOF class of the `referencedElement` and whose `ownedFeatures` are bound to the values of the MOF properties of the `referencedElement`.

body:
```
referencedElement.ownedElement->
    select(oclIsKindOf(MetadataFeature)
        and annotatedElement->includes(referencedElement))->
    including(metaclassFeature())
```

metaclassFeature() : MetadataFeature

Return a MetadataFeature whose `annotatedElement` is the `referencedElement`, whose `metaclass` is the reflective Metaclass corresponding to the MOF class of the `referencedElement` and whose `ownedFeatures` are bound to the MOF properties of the `referencedElement`.

modelLevelEvaluable(visited : Feature [0..*]) : Boolean

A MetadataAccessExpression is always model-level evaluable.

body: `true`

Constraints

checkMetadataAccessExpressionSpecialization

[no documentation]

8.3.4.8.13 NullExpression

Description

A NullExpression is an Expression that results in a null value. It must be typed by a *`NullEvaluation`* that results in an empty value.

General Classes

Expression

Attributes

None.

Operations

evaluate(target : Element) : Element [0..*]

The model-level value of a NullExpression is an empty sequence.

body: `Sequence{}`

modelLevelEvaluable(visited : Feature [0..*]) : Boolean

A NullExpression is always model-level evaluable.

body: `true`

Constraints

checkNullExpression Specialization

[no documentation]

8.3.4.8.14 OperatorExpression

Description

An OperatorExpression is an InvocationExpression whose `function` is determined by resolving its `operator` in the context of one of the standard Function packages from the Kernel Model Library.

General Classes

InvocationExpression

Attributes

operator : String

An operator symbol that names a corresponding Function from one of the standard Function packages from the Kernel Model Library .

Operations

No operations.

Constraints

checkOperatorExpressionSpecialization

[no documentation]

8.3.4.8.15 SelectExpression

Description

A SelectExpression is an OperatorExpression whose operator is `"select"`, which resolves to the library Function *`ControlFunctions::select`*.

General Classes

OperatorExpression

Attributes

operator : String {redefines operator}

Operations

No operations.

Constraints

None.

8.3.4.9 Interactions Abstract Syntax

8.3.4.9.1 Overview

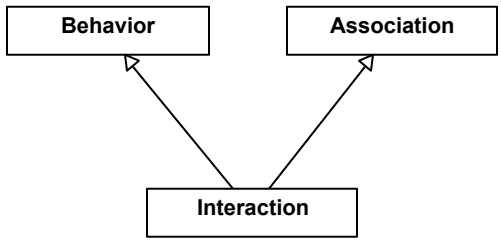

Figure 34. Interactions

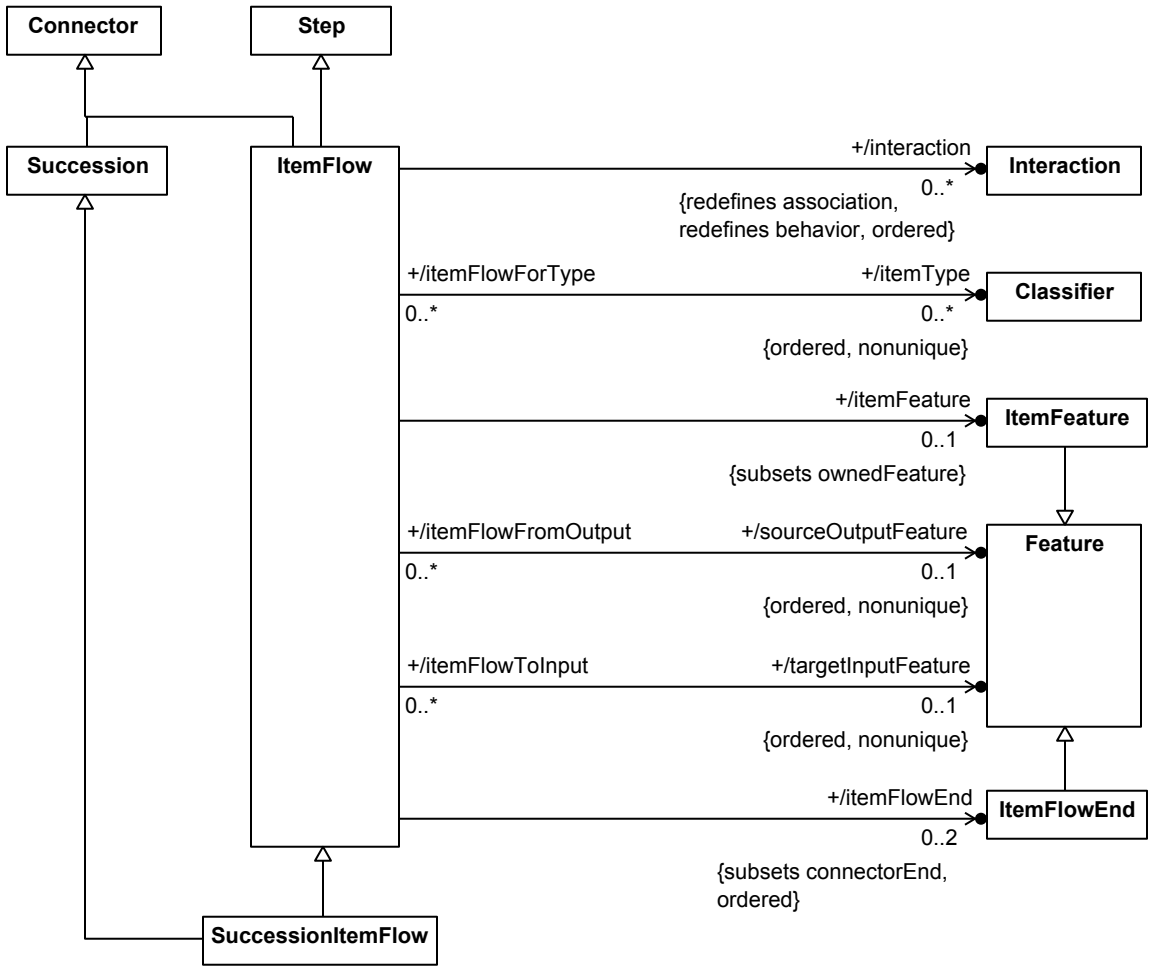

Figure 35. Item Flows

8.3.4.9.2 ItemFeature

Description

An ItemFeature is the `ownedFeature` of an ItemFlow that represents the payload of the transfers that are instances of the ItemFlow. It must redefine *`Transfer::item`*.

General Classes

Feature

Attributes

None.

Operations

No operations.

Constraints

checkItemFeatureRedefinition

[no documentation]

8.3.4.9.3 ItemFlow

Description

An ItemFlow is a Step that represents the transfer of objects or values from one Feature to another. ItemFlows can take non-zero time to complete.

An ItemFlow must be typed by the Interaction *`Transfer`* from the Kernel Semantic Library, or a specialization of it.

General Classes

Connector
Step

Attributes

/interaction : Interaction [0..*] {redefines association, behavior, ordered}

The Interactions that type this ItemFlow. Interactions are both Associations (which type Connectors) and Behaviors (which type Steps).

/itemFeature : ItemFeature [0..1] {subsets ownedFeature}

The Feature of the ItemFlow that is an ItemFeature, representing the payload in transit between the *`source`* and the *`target`* during a transfer over the ItemFlow.

/itemFlowEnd : ItemFlowEnd [0..2] {subsets connectorEnd, ordered}

The `connectorEnds` of this ItemFlow that are ItemFlowEnds.

/itemType : Classifier [0..*] {ordered, nonunique}

The type of the item transferred, derived as the `type` of the `itemFeature` of the ItemFlow.

/sourceOutputFeature : Feature [0..1] {ordered, nonunique}

The Feature that originates the ItemFlow. It must be an owned `output` of the `source` of the ItemFlow. If there is no such Feature, then the ItemFlow must be abstract.

/targetInputFeature : Feature [0..1] {ordered, nonunique}

The Feature that receives the ItemFlow. It must be an owned `output` of the target participant of the ItemFlow. If there is no such Feature, then the ItemFlow must be abstract.

Operations

Constraints

checkItemFlowSpecialization

[no documentation]

8.3.4.9.4 ItemFlowEnd

Description

An ItemFlowEnd is a Feature that is one of the `endFeatures` giving the *`source`* or *`target`* of an ItemFlow. It must have exactly one `ownedFeature`, which redefines *`Transfer::source::sourceOutput`* or *`Transfer::target::targetInput`* and redefines the corresponding feature of the `relatedElement` for its end.

8.3.4.10 Feature Values Abstract Syntax

8.3.4.10.1 Overview

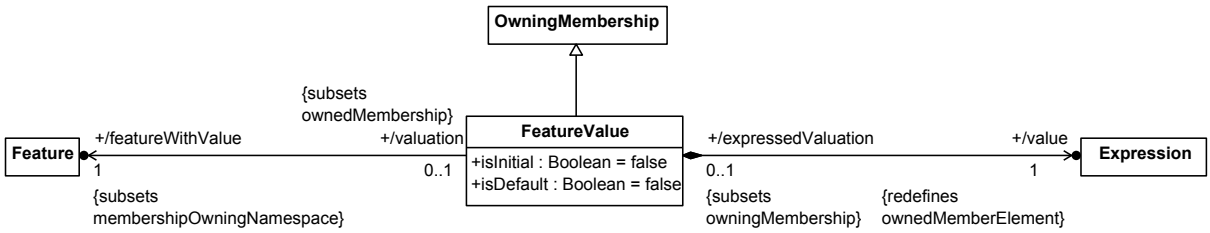

Figure 36. Feature Values

8.3.4.10.2 FeatureValue

Description

A FeatureValue is a Membership that identifies a particular member Expression that provides the value of the Feature that owns the FeatureValue. The value is specified as either a bound value or an initial value, and as either a concrete or default value. A Feature can have at most one FeatureValue.

The result of the `value` expression is bound to the `featureWithValue` using a BindingConnector. If `isInitial = false`, then the `featuringType` of the BindingConnector is the same as the `featuringType` of the `featureWithValue`. If `isInitial = true`, then the `featuringType` of the BindingConnector is restricted to its `startShot`.

If `isDefault = false`, then the above semantics of the FeatureValue are realized for the given `featureWithValue`. Otherwise, the semantics are realized for any individual of the `featuringType` of the `featureWithValue`, unless another value is explicitly given for the `featureWithValue` for that individual.

General Classes

OwningMembership

Attributes

/featureWithValue : Feature {subsets membershipOwningNamespace}

The Feature to be provided a value.

isDefault : Boolean

Whether this FeatureValue is a concrete specification of the bound of initial value of the `featureWithValue`, or just a default value that may be overridden.

isInitial : Boolean

Whether this FeatureValue specifies a bound value or an initial value for the `featureWithValue`.

/value : Expression {redefines ownedMemberElement}

The Expression that provides the value of the `featureWithValue` as its `result`.

Operations

No operations.

Constraints

checkFeatureValueBindingConnector

The `valueConnector` must be an `ownedMember` of the `featureWithValue` whose `relatedElements` are the `featureWithValue` and the `result` of the `value` Expression and whose `featuringTypes` are the same as those of the `featureWithValue`.

```
featureWithValue.ownedMember->
    selectByKind(BindingConnector)->
    exists(valueConnector |
        valueConnector.relatedFeature->includes(featureWithValue) and
        valueConnector.relatedFeature->includes(value.result) and
        valueConnector.featuringType = featureWithValue.featuringType)
```

8.3.4.11 Multiplicities Abstract Syntax

8.3.4.11.1 Overview

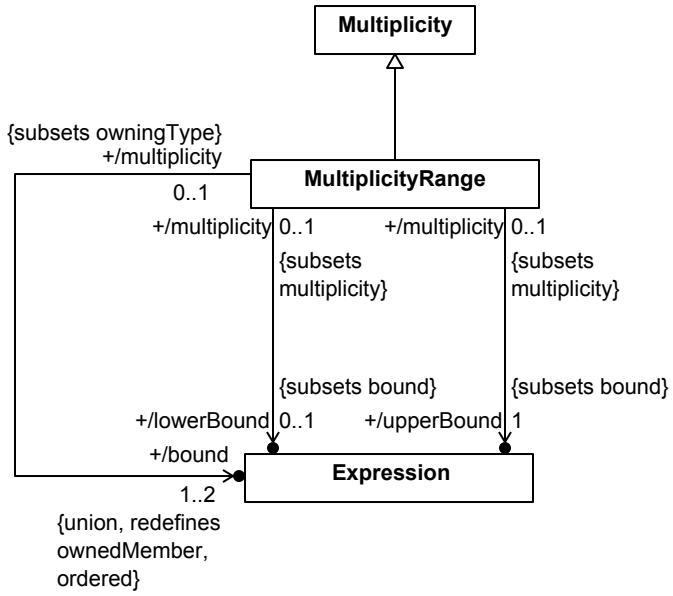

Figure 37. Multiplicities

8.3.4.11.2 MultiplicityRange

Description

A MultiplicityRange is a Multiplicity whose value is defined to be the (inclusive) range of natural numbers given by the result of a `lowerBound` Expression and the result of an `upperBound` Expression. The result of the `lowerBound` Expression shall be of type *Natural*, while the result of the `upperBound` Expression shall be of type *UnlimitedNatural*. If the result of the `upperBound` Expression is the unbounded value `*`, then the specified range includes all natural numbers greater than or equal to the `lowerBound` value.

General Classes

Multiplicity

Attributes

/bound : Expression [1..2] {redefines ownedMember, ordered, union}

The bound Expressions of the MultiplicityRange. These shall be the only `ownedMembers` of the MultiplicityRange.

/lowerBound : Expression [0..1] {subsets bound}

The Expression whose result provides the lower bound of MultiplicityRange. If no `lowerBound` Expression is given, then the lower bound shall have the same value as the upper bound, unless the upper bound is unbounded (`*`), in which case the lower bound shall be 0.

/upperBound : Expression {subsets bound}

The Expression whose result is the upper bound of the MultiplicityRange.

Operations

No operations.

Constraints

checkMultiplicityRangeExpressionDomain

The `bounds` of a MultiplicityRange shall have the same `featuringTypes` as the MultiplicityRange.

```
bound->forAll(b | b.featuringType = self.featuringType)
```

8.3.4.12 Metadata Abstract Syntax

8.3.4.12.1 Overview

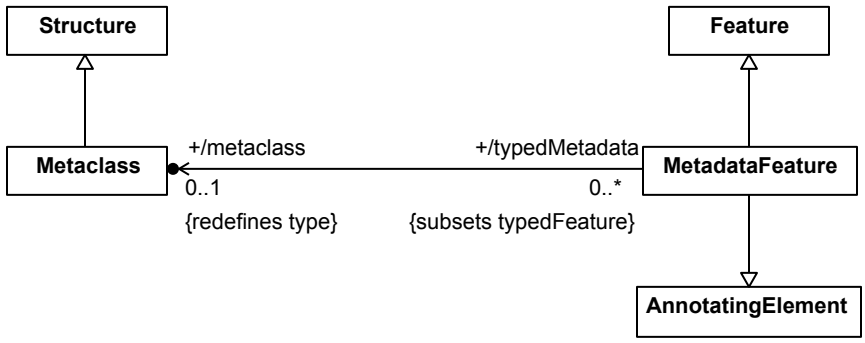

Figure 38. Metadata Annotation

8.3.4.12.2 Metaclass

Description

A Metaclass is a Structure used to type MetadataFeatures. It must subclassify, directly or indirectly, the base type *`Metadata`* from the Kernel Library.

General Classes

Structure

Attributes

None.

Operations

No operations.

Constraints

checkMetaclassSpecialization

[no documentation]

8.3.4.12.3 MetadataFeature

Description

A MetadataFeature is a Feature that is an AnnotatingElement used to annotate another Element with metadata. It is typed by a Metaclass. All its `ownedFeatures` must redefine `features` of its `metaclass` and any feature bindings must be model-level evaluable.

A MetadataFeature must subset, directly or indirectly, the base MetadataFeature *`metadata`* from the Kernel Library.

General Classes

AnnotatingElement
Feature

Attributes

/metaclass : Metaclass [0..1] {redefines type}

The `type` of this AnnotatingFeature, which must be a DataType.

Operations

No operations.

8.3.4.13 Packages Abstract Syntax

8.3.4.13.1 Overview

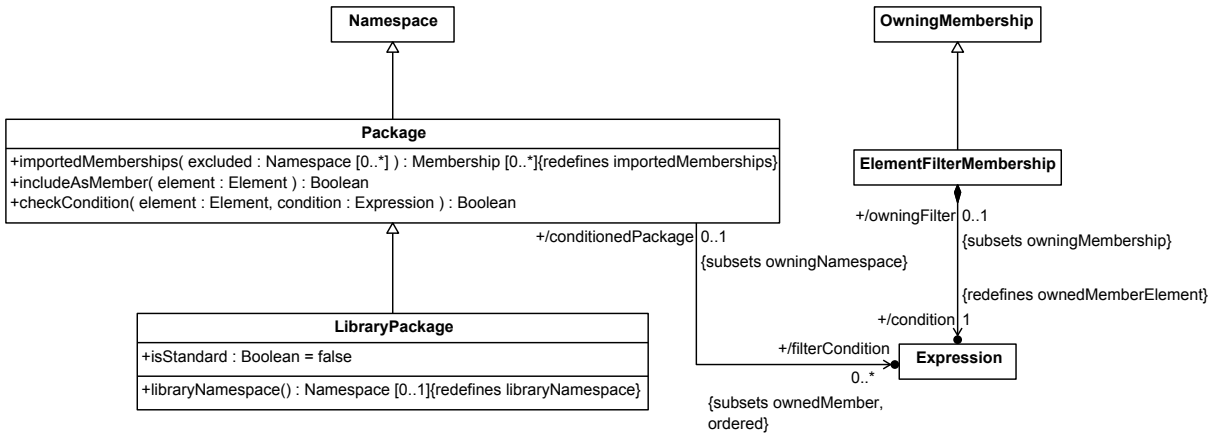

Figure 39. Packages

8.3.4.13.2 ElementFilterMembership

Description

ElementFilterMembership is a Mambership between a Namespace and a model-level evaluable Boolean Expression, asserting that imported `members` of the Namespace should be filtered using the `condition` Expression. A general Namespace does not define any specific filtering behavior, but such behavior may be defined for various specialized kinds of Namespaces.

General Classes

OwningMembership

Attributes

/condition : Expression {redefines ownedMemberElement}

The model-level evaluable Boolean Expression used to filter the `members` of the `membershipOwningNamespace` of this ElementFilterMembership.

Operations

No operations.

Constraints

validatePackageElementFilterIsBoolean

The `result` Feature of the `condition` Expression must have *`ScalarValues::Boolean`* as its `type`.

validatePackageElementFilterIsModelLevelEvaluable

The `condition` Expression must be model-level evaluable.

```
condition.isModelLevelEvaluable
```

8.3.4.13.3 LibraryPackage

Description

A LibraryPackage is a Package that is the container for a model library. A LibraryPackage is itself a library Element as are all Elements that are directly or indirectly contained in it.

General Classes

Package

Attributes

isStandard : Boolean

Whether this LibraryPackage contains a standard library model. This should only be set to true for LibraryPackage in the standard Kernel Libraries or in normative model libraries for a language built on KerML.

Operations

libraryNamespace() : Namespace [0..1]

The library Namespace for a LibraryPackage is itself.

body: `self`

Constraints

None.

8.3.4.13.4 Package

Description

A Package is a Namespace used to group Elements, without any instance-level semantics. It may have one or more model-level evaluable `filterCondition` Expressions used to filter its `importedMemberships`. Any imported `member` must meet all of the `filterConditions`.

General Classes

Namespace

Attributes

/filterCondition : Expression [0..*] {subsets ownedMember, ordered}

The model-level evaluable Boolean Expressions used to filter the `members` of this Package, derived as those `ownedMembers` of the Package that are owned via ElementFilterMembership.

Operations

checkCondition(element : Element,condition : Expression) : Boolean

Model-level evaluate the given `condition` Expression with the given `element` as its target. If the result is a LiteralBoolean, return its `value`. Otherwise return `false`.

```
body: let results: Sequence(Element) = condition.evaluate(element) in
    result->size() = 1 and
    results->at(1).oclIsKindOf(LiteralBoolean) and
    results->at(1).oclAsType(LiteralBoolean).value
```

importedMemberships(excluded : Namespace [0..*]) : Membership [0..*]

Exclude Elements that do not meet all the `filterConditions`.

```
body: self.oclAsType(Namespace).importedMemberships(excluded)->
    select(m | self.includeAsMember(m.memberElement))
```

includeAsMember(element : Element) : Boolean

Determine whether the given `element` meets all the `filterConditions`.

```
body: let metadataAnnotations: Sequence(AnnotatingElement) =
    element.ownedAnnotation.annotatingElement->
        select(oclIsKindOf(AnnotatingFeature)) in
    self.filterCondition->forAll(cond |
        metadataAnnotations->exists(elem |
            self.checkCondition(elem, cond)))
```

Constraints

None.

8.4 Semantics

8.4.1 Semantics Overview

A KerML model is intended to *represent* a system being modeled. The model is *interpreted* to make statements about the modeled system. The model may describe an existing system, in which case, if the model is correct, the statements it is interpreted to make about the system should all be true. A model may also be used to specify an imagined or planned system, in which case the statements the model is interpreted to make should be true for any system that is properly constructed and operated according to the model.

The *semantics* of KerML specify how a KerML model is to be interpreted. The semantics are defined in terms of the abstract syntax representation of the model, and only for models which are *valid* relative to the structure and constraints specified for the KerML abstract syntax (see 8.3). As further specified in this subclause, models expressed in KerML are given semantics by implicitly reusing elements from the semantic models in the Kernel Model Library (see Clause 9). These library models represent conditions on the structure and behavior of the system being modeled, which are further augmented in a user model as appropriate.

A formal specification of semantics allows models to be interpreted consistently. In particular, all KerML models extend library models expressed in KerML itself, understandable by KerML modelers. These library models can then be ultimately reduced to a small, core subset of KerML, which is grounded in mathematical logic. The goal is to provide uniform model interpretation, which improves communication between everyone involved in modeling, including modelers and tool builders.

KerML semantics are specified by a combination of mathematics and model libraries, as illustrated in Fig. 40. The left side of this diagram shows the abstract syntax packages corresponding to the three layers of KerML (see 6.1). The right side shows the corresponding semantic layering.

1. The Root Layer defines the syntactic foundation KerML and, as such, does not have a semantic interpretation relative to the modeled system.
2. The Core Layer is grounded in mathematical semantics, supported by the `Base` package from the Kernel Model Library (see 9.2.2). Subclause 8.4.3 specifies the semantics of the Core layer.
3. The Kernel Layer is given semantics fully through its relationship to the Model Library (see Clause 9). Subclause 8.4.4 specifies the semantics of the Kernel layer .

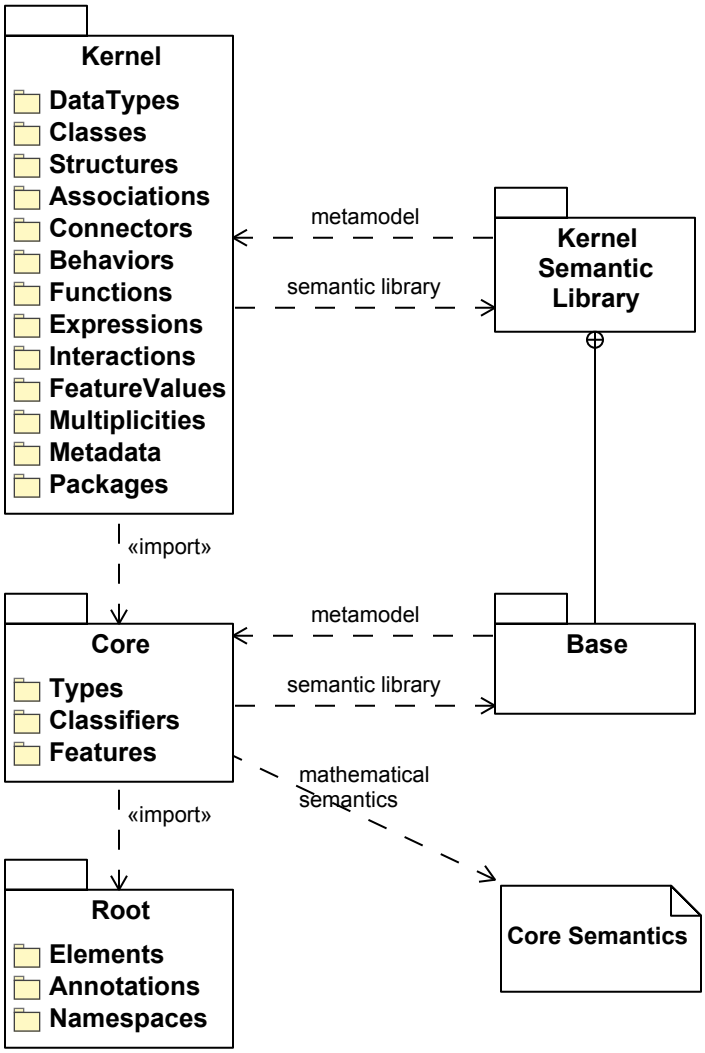

Figure 40. KerML Semantic Layers

8.4.2 Semantic Constraints and Implied Relationships

As described in 8.4.1, KerML semantics are specified by a combination of a mathematical interpretation of the Core layer and a set of required relationships between Core and Kernel model elements and elements of the Kernel Semantic Library (see 9.2). The latter requirements are formalized by *semantic constraints* included in the KerML abstract syntax (see also 8.3.1 on the various kinds of constraints in the abstract syntax). Additionally, other

semantic constraints require relationships between elements within a user model necessary for the model to be semantically well formed.

Specifically, there are four categories of semantic constraints, each dealing with a different kind of relationship.

1. *Specialization constraints.* These constraints require that `Type` elements of a certain kind directly or indirectly specialize some specific base `Type` from the Kernel Semantic Library. They are the fundamental means for providing semantics to abstract syntax elements in the Kernel layer. Specialization constraints always have the word `Specialization` in their name. For example, `checkDataTypeSpecialization` requires that a `DataType` directly or indirectly specialize the Semantic Library `DataType` *`Base::DataValue`*.
2. *Redefinition constraints.* These constraints require that certain `Features` in a model have `Redefinition` relationships with certain other `Features` in the model. While `Redefinitions` are kinds of `Specializations`, redefinition constraints differ from the specialization constraints described above in that they are between two elements of a user model, rather than between an element of a user model and an element of a library model. Redefinition constraints always have the word `Redefinition` in their name. For example, `checkConnectorEndRedefinition` requires that the ends of a `Connector` redefine any ends of the `Types` that it specializes.
3. *Type-featuring constraints.* These constraints require that certain `Features` in a model have `TypeFeaturing` relationships with certain other `Types` in the model. They arise at points in a model in which the `OwningMembership` structure is different than the required `Featuring` relationship, so `FeatureMembership` cannot be used. Type-featuring constraints always have the words `TypeFeaturing` in their name. For example, `checkFeatureValueExpressionFeatureTyping` requires that the `value Expression` owned by a `FeatureValue` relationship (a kind of `OwningMembership`) have the same `featuringTypes` as the owning `featureWithValue` of the `FeatureValue`, rather than being featured by the `featureWithValue` itself (as would have been the case for a `FeatureMembership`).
4. *Binding-connector constraints.* These constraints require that `BindingConnectors` exist between certain Features in a model. The primary example of such a constraint is `checkFeatureValueBindingConnector`, which requires that the `featureWithValue` of a `FeatureValue` own a `BindingConnector` between itself and the `result` parameter of the `value Expression` of the `FeatureValue`.

A KerML model parsed from the textual concrete syntax (see 8.2) or obtained through model interchange (see Clause 10) will not necessarily meet the semantic constraints specified for the abstract syntax. In this case, a tool may insert certain *implied relationships* into the model in order to meet the semantic constraints. The semantic specification for various kinds of `Types` in the Core (see 8.4.3) and Kernel (see 8.4.4) layers defines what implied relationship should be included to satisfy each semantic constraint that would otherwise be violated. In all cases, the semantics of a model are only defined if it meets all semantic and validation constraints (see 8.3.1).

When including implied relationships for specialization constraints, it is possible that multiple such constraints may apply to a single element. For example, a `Structure` is a kind of `Class`, which is a kind of `Classifier`, and there are specialization constraints for all three of these metaclasses, with corresponding implied `Specialization` relationships. However, simply including all three implied `Specializations` would be redundant, because the `Specialization` implied by the `checkStructureSpecialization` constraint will also automatically satisfy the `checkClassSpecialization` and `checkClassifierSpecialization` constraints. Therefore, in order to avoid redundant relationships, a tool should observe the following rules when selecting which `Specializations` to actually include for a certain `specific` Type element, out of the set of those implied by all specialization constraints applicable to the element:

1. If there is any `ownedSpecialization` or other implied `Specialization` whose `general Type` is a direct or indirect subtype of (but not the same as) the `general Type` of an implied `Specialization`, or

if there is an `ownedSpecialization` with the same `general Type`, then that implied `Specialization` should *not* be included.

2. If there are two implied `Specializations` with the same `general Type`, then only one should be included.

Note that the above rules do *not* apply to `Redefinitions` implied by redefinition constraints, because `Redefinition` relationships have semantics beyond just basic specialization.

8.4.3 Core Semantics

8.4.3.1 Core Semantics Overview

The Core semantics are defined mathematically, using a model-theoretic approach. Core mathematical semantics is expressed in first order logic notation, extended as follows:

1. Quantifiers can specify that variable values must be members of particular sets, rather than leaving this to the body of the statement ($\forall t_g \in V_T$ ... is short for $\forall t_g \ t_g \in V_T \Rightarrow$ ...). The same set can be given once for multiple variables ($\forall t_g, t_s \in V_T$ ... is short for $\forall t_g, t_s \ t_g \in V_T \wedge t_s \in V_T \Rightarrow$ ...).
2. Dots (.) appearing between metaproperty names have the same meaning as in OCL, including implicit collections [OCL].
3. Sets are identified in the usual set-builder notation, which specifies members of a set between curly braces ("{}"). The notation is extended with "#" before an opening brace to refer to the cardinality of a set.

Element names appearing in the mathematical semantics refer to the element itself, rather than its instances, using the same font conventions as given in 8.1.

The mathematical semantics use the following model-theoretic terms, explained in terms of this specification:

- *Vocabulary*: Model elements conforming to the KerML abstract syntax, with additional restrictions given in this subclause.
- *Universe*: All actual or potential things the vocabulary could possibly be about.
- *Interpretation*: The relationship between vocabulary and mathematical structures made of elements of the universe.

The above terms are formally defined below.

- A vocabulary $V = (V_T, V_C, V_F)$ is a 3-tuple where:
  - V_T is a set of types (model elements classified by Type or its specializations, see 8.3.3.1).
  - $V_C \subseteq V_T$ is a set of classifiers (model elements classified by Classifier or its specializations, see 8.3.3.2), including at least `Base::Anything` from KerML model library, see 9.2.2).
  - $V_F \subseteq V_T$ is a set of features (model elements classified by Feature or its specializations, see 8.3.3.3), including at least `Base::things` from the KerML model library (see 9.2.2).
  - $V_T = V_C \cup V_F$
- An interpretation $I = (\Delta, \cdot^T)$ for V is a 2-tuple where:
  - Δ is a non-empty set (*universe*), and
  - $\cdot^T$ is an (*interpretation*) function relating elements of the vocabulary to sets of sequences of elements of the universe. It has domain V_T and co-domain that is the power set of S, where

    $S = \cup_{i \in Z^+} \Delta^i$

    S is the set of all n-ary Cartesian products of Δ with itself, including 1-products, but not 0-products, which are called *sequences*. The Semantics subclauses give other restrictions on the interpretation function.

The semantics of KerML are restrictions on the interpretation relationship, as given mathematically in this and subsequent subclauses on the Core semantics. The phrase *result of interpreting* a model (vocabulary) element refers

to sequences paired with the element by $\cdot^T$. This specification also refers to this as the *interpretation* of the model element, for short.

The function $\cdot^{minT}$ specializes $\cdot^T$ to the subset of sequences in an interpretation that have no others as tails, except when applied to *Anything*.

$$\forall t \in \texttt{Type}, s_1 \in S \;\; s_1 \in (t)^{minT} \equiv s_1 \in (t)^T \wedge (t \neq \texttt{Anything} \Rightarrow (\forall s_2 \in S \;\; s_2 \in (t)^T \wedge s_2 \neq s_1 \Rightarrow \neg tail(s_2, s_1)))$$

Functions and predicates for sequences are introduced below. Predicates prefixed with `form:` are defined in [fUML], Clause 10 (Base Semantics).

- *length* is a function version of fUML's *sequence-length*.

  $$\forall s, n \;\; n = length(s) \equiv (\texttt{form:sequence-length}\ s\ n)$$

- *at* is a function version of fUML's *in-position-count*.

  $$\forall x, s, n \;\; x = at(s, n) \equiv (\texttt{form:in-position-count}\ s\ n\ x)$$

- *head* is true if the first sequence is the same as the second for some or all of the second starting at the beginning, otherwise is false.

  $$\forall s_1, s_2 \;\; head(s_1, s_2) \Rightarrow \texttt{form:Sequence}(s_1) \wedge \texttt{form:Sequence}(s_2)$$
  $$\forall s_1, s_2 \;\; head(s_1, s_2) \equiv (length(s_1) \leq length(s_2)) \wedge$$
  $$(\forall p \in \mathbb{Z}^+ \;\; p \geq 1 \wedge p \leq length(s_1) \Rightarrow at(s_1, p) = at(s_2, p))$$

- *tail* is true if the first sequence is the same as the second for some or all of the second finishing at the end, otherwise is false:

  $$\forall s_1, s_2 \;\; tail(s_1, s_2) \Rightarrow \texttt{form:Sequence}(s_1) \wedge \texttt{form:Sequence}(s_2)$$
  $$\forall s_1, s_2 \;\; tail(s_1, s_2) \equiv (length(s_1) \leq length(s_2)) \wedge$$
  $$(\forall h, p \in \mathbb{Z}^+ \;\; (h = length(s_2) - length(s_1)) \wedge (p > h) \wedge (p \leq length(s_2) \Rightarrow at(s_1, p - h) = at(s_2, p))$$

- *concat* is true if the first sequence has the second as head, the third as tail, and its length is the sum of the lengths of the other two, otherwise is false.

  $$\forall s_0, s_1, s_2 \;\; concat(s_0, s_1, s_2) \Rightarrow \texttt{form:Sequence}(s0) \wedge \texttt{form:Sequence}(s1) \wedge \texttt{form:Sequence}(s2)$$
  $$\forall s_0, s_1, s_2 \;\; concat(s_0, s_1, s_2) \equiv (length(s_0) = length(s_1) + length(s_2)) \wedge head(s_1, s_0) \wedge tail(s_2, s_0)$$

- *reverse* is true if the sequences have the same elements, but in reverse order, otherwise is false.

  $$\forall s_1, s_2 \;\; reverse(s_1, s_2) \Rightarrow \texttt{form:Sequence}(s1) \wedge \texttt{form:Sequence}(s2)$$
  $$\forall s_1, s_2 \;\; reverse(s_1, s_2) \equiv (length(s_1) = length(s_2)) \wedge$$
  $$(\forall p \in \mathbb{Z}^+ \;\; p \geq 1 \wedge p \leq length(s_1) \Rightarrow at(s_1, (length(s_1) - p + 1) = at(s_2, p))$$

8.4.3.2 Types Semantics

Abstract syntax reference: 8.3.3.1

The interpretation of Types in a model shall satisfy the following rules:

1. All sequences in the interpretation of a `Type` are in the interpretations of the `Types` it specializes.

   $$\forall t_g, t_s \in V_T \;\; t_g \in t_s.\texttt{specialization.general} \Rightarrow (t_s)^T \subseteq (t_g)^T$$

2. No sequences in the interpretation of a `Type` are in the interpretations of its disjoining `Types`.

$$\forall t, t_d \in V_T \;\; t_d \in t.\texttt{disjoiningTypeDisjoining.disjoiningType} \Rightarrow ((t)^T \cap (t_d)^T = \emptyset)$$

In addition, the `checkTypeSpecialization` constraint requires that all Types directly or indirectly specialize *`Base::Anything`* (see 9.2.2.2.1). However, there is *no* implied relationship defined to satisfy this constraint for a Type that is not a Classifier or a Feature. For the implied relationships relevant to Classifiers and Features, see 8.4.3.3 and 8.4.3.4, respectively.

8.4.3.3 Classifiers Semantics

Abstract syntax reference: 8.3.3.2

The interpretation of the `Classifiers` in a model shall satisfy the following rules:

1. If the interpretation of a `Classifier` includes a sequence, it also includes the 1-tail of that sequence.

$$\forall c \in V_C, s_1 \in S \;\; s_1 \in (c)^T \Rightarrow (\forall s_2 \in S \;\; tail(s_2, s_1) \wedge length(s_2) = 1 \Rightarrow s_2 \in (c)^T)$$

2. The interpretation of the `Classifier` *`Anything`* includes all sequences of all elements of the universe.

$$(\texttt{Anything})^T = S$$

Table 8. Classifiers Implied Relationships

Semantic constraint	Implied Relationship	Target
`checkTypeSpecialization`	`Subclassification`	*`Base::Anything`* (see 9.2.2.2.1)

Notes

1. The `checkTypeSpecialization` constraint applies to all `Types`, but the implied relationship is only for `Types` that are `Classifiers`.

8.4.3.4 Features Semantics

Abstract syntax reference: 8.3.3.3

The interpretation of the Features in a model shall satisfy the following rules:

1. The interpretations of features must have length greater than one.

$$\forall s \in S, f \in V_F \;\; s \in (f)^T \Rightarrow length(s) > 1$$

2. The interpretation of the Feature *`things`* is all sequences of length greater than one.

$$(\texttt{things})^T = \{ s \mid s \in S \wedge length(s) > 1 \}$$

See other rules below.

Features interpreted as sequences of length two or more can be treated as if they were interpreted as sets of ordered pairs (binary relations), where the first and second elements of each pair are from the domain and co-domain of the Feature, respectively. The predicate *feature-pair* below determines whether two sequences can be treated in this way.

Two sequences are a *feature pair* of a Feature if and only if the interpretation of the Feature includes a sequence s_0 such that following are true:

- s_0 is the concatenation of the two sequences, in order.
- The first sequence is in the minimal interpretation of all `featuringTypes` of the Feature.
- The second sequence is in the minimal interpretations of all `types` of the Feature.

$$\begin{aligned}&\forall s_1, s_2 \in S, f \in V_F \;\; \textit{feature-pair}(s_1, s_2, f) \equiv \\ &\quad \exists s_0 \in S \;\; s_0 \in (f)^T \wedge \textit{concat}(s_0, s_1, s_2) \;\; \wedge \\ &\qquad (\forall t_1 \in V_T \;\; t_1 \in f.\texttt{featuringType} \Rightarrow s_1 \in (t_1)^{minT}) \;\; \wedge \\ &\qquad (\forall t_2 \in V_T \;\; t_2 \in f.\texttt{type} \Rightarrow s_2 \in (t_2)^{minT})\end{aligned}$$

The interpretation of the Features in a model shall satisfy the following rules:

3. All sequences in an interpretation of a Feature have a non-overlapping head and tail that are feature pairs of the Feature.

   $$\begin{aligned}&\forall s_0 \in S, f \in V_F \;\; s_0 \in (f)^T \Rightarrow \exists s_1, s_2 \in S \;\; \textit{head}(s_1, s0) \wedge \textit{tail}(s2, s_0) \wedge \\ &\quad (\textit{length}(s_0) \geq \textit{length}(s_1) + \textit{length}(s_2)) \wedge \textit{feature-pair}(s_1, s_2, f)\end{aligned}$$

4. Values of `redefiningFeatures` are the same as the values of their `redefinedFeatures` restricted to the domain of the `redefiningFeature`.

   $$\begin{aligned}&\forall f_g, f_s \in V_F \;\; f_g \in f_s.\texttt{redefinedFeature} \Rightarrow \\ &\quad (\forall s_1 \in S \;\; (\forall ft_s \in V_T \; ft_s \in f_s.\texttt{featuringType} \Rightarrow s_1 \in (ft_s)^{minT}) \Rightarrow \\ &\qquad (\forall s_2 \in S \; (\textit{feature-pair}(s_1, s_2, f_s) \equiv \textit{feature-pair}(s_1, s_2, f_g))))\end{aligned}$$

5. The multiplicity of a Feature includes the cardinality of its values.

   $$\forall s_1 \in S, f \in V_F \;\; \#\{s_2 \mid \textit{feature-pair}(s_1, s_2, f)\} \in (f.\texttt{multiplicity})^T$$

6. Sequences in the interpretation of an inverting feature are the reverse of those in the inverted feature.

   $$\begin{aligned}&\forall f_1, f_2 \in V_F \;\; f_2 \in f_1.\texttt{invertingFeatureInverting.invertingFeature} \Rightarrow \\ &\quad (\forall s_1 \in S \;\; s_1 \in (f_1)^T \equiv \; (\exists s_2 \in S \;\; s_2 \in (f_2)^T \wedge \textit{reverse}(s_2, s_1)))\end{aligned}$$

7. The interpretation of a Feature with a chain is determined by the interpretations of the subchains, see additional predicates below.

   $$\forall f \in V_F, \textit{cfl} \;\; \textit{cfl} = f.\textit{chainingFeature} \wedge \texttt{form:Sequence}(\textit{cfl}) \wedge \textit{length}(\textit{cfl}) > 1 \Rightarrow \textit{chain-feature-n}(f, \textit{cfl})$$

The interpretations of a Feature (f) derived from a chain of two others (f_1 and f_2) are all the sequences formed from feature pairs of the two others that share the same sequence as second and first in their pairs, respectively.

$$\begin{aligned}&\forall f, f_1, f_2 \;\; \textit{chain-feature-2}(f, f_1, f_2) \;\Rightarrow f \in V_F \;\wedge\; f_1 \in V_F \;\wedge\; f_2 \in V_F \\ &\forall f, f_1, f_2 \;\; \textit{chain-feature-2}(f, f_1, f_2) \equiv \\ &\quad (\forall s_d, s_{cd} \in S \;\; \textit{feature-pair}(s_d, s_{cd}, f) \equiv \\ &\qquad \exists s_m \in S \, \textit{feature-pair}(s_d, s_m, f_1) \;\wedge\; \textit{feature-pair}(s_m, s_{cd}, f_2))\end{aligned}$$

The interpretations of a Feature (f) derived from a chain of two or more others (fl, a list of features longer than 1) is the last in a series of features (flc) that are features derived from subchains, starting with the first two Features in fl, (deriving the first Feature in flc), then the first three (deriving the second Feature in flc), and so on, to all the Features in fl (deriving the last feature in flc, which is the original Feature f).

$$
\begin{aligned}
&\forall f, fl \ \ chain\text{-}feature\text{-}n(f, fl) \Rightarrow \\
&\quad f \in V_F \ \wedge \ fl \subseteq V_F \ \wedge \ \texttt{form:Sequence}(fl) \ \wedge \ length(fl) > 1 \\
&\forall f, fl \ \ chain\text{-}feature\text{-}n(f, fl) \equiv \\
&\quad \exists flc \ flc \subseteq V_F \ \wedge \ \texttt{form:Sequence} \ \wedge \ length(flc) = length(fl) - 1 \ \wedge \\
&\qquad (\forall i \in \mathbb{Z}^+ \ i > 1 \ \wedge \ i <= length(fl) \Rightarrow \\
&\qquad\quad chain\text{-}feature\text{-}2(at(flc, i - 1), \ at(fl, i - 1), \ at(fl, i))) \ \wedge \\
&\qquad\quad f = at(flc, \ length(flc))
\end{aligned}
$$

Table 9. Features Implied Relationships

Semantic Constraint	Implied Relationship	Target
`checkFeatureSpecialization`	`Subsetting`	*`Base::things`* (see 9.2.2.2.6)

Notes

1. Satisfaction of the `checkFeatureSpecialization` constraint is actually implied semantically by semantic rules 1 and 2 above, combined with the definition of $.^T$ in 8.4.3.1.

Table 10. Feature Constraints Supporting Kernel Semantics

Semantic Constraint	Supporting
`checkFeatureDataValueSpecialization`	Data Types Semantics (see 8.4.4.2)
`checkFeatureOccurrenceSpecialization` `checkFeatureSuboccurrenceSpecialization`	Classes Semantics (see 8.4.4.3)
`checkFeatureObjectSpecialization` `checkFeatureSubobjectSpecialization`	Structures Semantics (see 8.4.4.4)
`checkFeatureEndSpecialization`	Associations Semantics (see 8.4.4.5)
`checkFeatureEndRedefinition`	Associations Semantics (see 8.4.4.5) Connectors Semantics (see 8.4.4.6)
`checkFeatureParameterRedefinition`	Behaviors and Steps Semantics (see 8.4.4.7)
`checkFeatureResultRedefinition`	Functions and Expressions Semantics (see 8.4.4.8)
`checkFeatureResultSpecialization`	Expressions Semantics (see 8.4.4.9)
`checkFeatureItemFlowFeatureRedefinition`	Item Flows Semantics (see 8.4.4.10)
`checkFeatureValuationBindingConnector`	Feature Values Semantics (see 8.4.4.11)

8.4.4 Kernel Semantics

8.4.4.1 Kernel Semantics Overview

The semantics of constructs in the Kernel Layer are specified in terms of the foundational constructs defined in the Core layer supported by reuse of model elements from the Kernel Semantic Model Library (see 9.2). The most common way in which model elements are used is through specialization, in order to meet subtyping constraints specified in the abstract syntax. For example, `Classes` are required to (directly or indirectly) subclassify *`Object`* from the *`Objects`* library model, while `Features` typed by `Classes` must subset *`objects`*. Similarly, `Behaviors` must subclassify *`Performance`* from the *`Performances`* library model, while `Steps` (`Features` typed by `Behaviors`) must subset *`performances`*. The requirement for such specialization is specified by specialization

constraints in the abstract syntax (see 8.4.2 for discussion of specialization constraints and other kinds semantic constraints).

Sometimes more complicated reuse patterns are needed. For example, binary `Associations` (with exactly two ends) specialize *`BinaryLink`* from the library, and additionally require the ends of the `Association` to redefine the *`source`* and *`target`* ends of *`BinaryLink`*. Such patterns are specified by redefinition constraints and other kinds of semantic constraints in the abstract syntax (see 8.4.2). In all cases, all Kernel syntactic constructs can be ultimately reduced to semantically equivalent Core patterns. Various elements of the Kernel abstract syntax essentially act as "markers" for modeling patterns typing the Kernel to the Core.

The following subclauses specify the semantics for each syntactic area of the Kernel Layer in terms of the semantic constraints that must be satisfied for various Kernel elements, the pattern of relationships these imply, and the model library elements that are reused to support this.

8.4.4.2 Data Types Semantics

Abstract syntax reference: 8.3.4.1

The `checkDataTypeSpecialization` constraint requires that `DataTypes` specialize the base `DataType` *`Base::DataValue`* (see 9.2.2.2.2). The `checkFeatureDataValueSpecialization` constraint requires that `Features` typed by a `DataType` specialize the `Feature` *`Base::dataValues`* (see 9.2.2.2.3), which is typed by *`Base::DataValue`*.

```
datatype D specializes Base::DataValue {
    feature a : ScalarValue::String subsets Base::dataValues;
    feature b : D subsets Base::dataValues;
}
```

The `Type` *`Base::DataValue`* is disjoint with *`Occurrences::Occurrence`* and *`Links::Link`*, the base `Types` for `Classes` and `Associations` (see 8.4.4.3 and 8.4.4.5, respectively). This means that a `DataType` cannot specialize a `Class` or `Association` and that a `Feature` typed by a `DataType` cannot also be typed by a `Class` or `Association`.

Table 11. Data Types Implied Relationships

Semantic Constraint	Implied Relationship	Target
`checkDataTypeSpecialization`	`Subclassification`	*`Base::DataValue`* (see 9.2.2.2.2)
`checkFeatureDataValue Specialization`	`Subsetting`	*`Base::dataValues`* (see 9.2.2.2.3)

Notes

1. The `checkFeatureDataValueSpecialization` constraint applies to `Features` typed by `DataTypes` (see also 8.3.3.3).

8.4.4.3 Classes Semantics

Abstract syntax reference: 8.3.4.2

The `checkClassSpecialization` constraint requires that `Classes` specialize the base `Class` *`Occurrences::Occurrence`* (see 9.2.4.2.14). The `checkFeatureOccurrenceSpecialization` constraint requires that `Features` typed by a `Class` specialize the `Feature` *`Occurrences::occurrences`* (see 9.2.4.2.15), which is typed by *`Occurrences::Occurrence`*. Further, the `checkFeatureSuboccurrenceSpecialization`

constraint requires that composite Features typed by a Class, and whose ownedType is a Class or another Feature typed by a Class, specialize the Feature *Occurrences::Occurrence::suboccurrences* (see 9.2.4.2.14), which subsets *Occurrences::occurrences*.

```
class C specializes Occurrences::Occurrence {
    feature a : C subsets Occurrences::occurrences;
    composite feature b : C subsets Occurrences::Occurrence::suboccurrences;
}
```

The Type *Occurrences::Occurrence* is disjoint with *Base::DataValues*, the base Type for DataTypes (see 8.4.4.2). This means that a Class cannot specialize a DataType and that a Feature typed by a Class cannot also be typed by a DataType. Note that *Occurrences::Occurrence* is *not* disjoint with *Link::Links*, because an AssociationStructure is both an Association and a Structure (which is a kind of Class), so the base AssociationStructure *Objects::LinkObject* specializes both *Link::Links* and (indirectly) *Occurrences::Occurrence*.

Unlike *DataValues*, *Occurrences* are modeled as occurring in three-dimensional space and persisting over time. The *Occurrences* library model includes an extensive set of Associations between *Occurrences* that model various spatial and temporal relations, such as *InsideOf*, *OutsideOf*, *HappensBefore*, *HappensDuring*, etc. In particular, the Association *HappensBefore* is the base Type for Successions, the basic modeling construct for time-ordering *Occurrences* (see 8.4.4.6 on the semantics of Successions). For further detail on the *Occurrences* model, see 9.2.4.1.

Table 12. Classes Implied Relationships

Semantic Constraint	Implied Relationship	Target
checkClassSpecialization	Subclassification	*Occurrences::Occurrence* (see 9.2.4.2.14)
checkFeatureOccurrence Specialization	Subsetting	*Occurrences::occurrences* (see 9.2.4.2.15)
checkFeatureSuboccurrence Specialization	Subsetting	*Occurrences::Occurrence::subccurrences* (see 9.2.4.2.14)

Notes

1. The checkFeatureOccurrenceSpecialization constraint applies to Features typed by Classes (see also 8.3.3.3).
2. The checkFeatureSuboccurrenceSpecialization constraint applies to composite Features typed by Classes whose ownedType is a Class or another Feature typed by a Class (see also 8.3.3.3).

8.4.4.4 Structures Semantics

Abstract syntax reference: 8.3.4.3

The checkStructureSpecialization constraint requires that Structures specialize the base Structure *Objects::Object* (see 9.2.5.2.7). The checkFeatureObjectSpecialization constraint requires that Features typed by a Structure specialize the Feature *Objects::object*s (see 9.2.5.2.8), which is typed by *Objects::Object*. Further, the checkFeatureSubobjectSpecialization constraint requires that composite Features typed by a Structure, and whose ownedType is a Structure or another Feature typed by a Structure, specialize the Feature *Objects::Object::subobjects* (see 9.2.5.2.7), which subsets *Object::objects*.

```
struct S specializes Objects::Object {
    feature a : S subsets Object::objects;
    composite feature b : S subsets Objects::Object::subobjects;
}
```

Objects are *Occurrences* representing physical or virtual structures that occur over time. For physical structures, the *Objects* library model also provides a the specialization *StructuredSpaceObject*, which models *Objects* that can be spatial decomposed into cells of the same or lower dimension. The Type *Object* is disjoint with the Type *Performance*, another specialization of *Occurrence*, which is the base Type for Behaviors (see 8.4.4.7 on the semantics of Behaviors). For further detail on the *Objects* model, see 9.2.5.1.

Table 13. Structures Implied Relationships

Semantic Constraint	Implied Relationship	Target
checkStructureSpecialization	Subclassification	*Objects::Object* (see 9.2.5.2.7)
checkFeatureObject Specialization	Subsetting	*Objects::objects* (see 9.2.5.2.8)
checkFeatureSubobject Specialization	Subsetting	*Objects::Object::subobjects* (see 9.2.5.2.7)

Notes

1. The checkFeatureObjectSpecialization constraint applies to Features typed by Structures (see also 8.3.3.3).
2. The checkFeatureSubobjectSpecialization constraint applies to Features typed by Structures whose owningType is a Structure or another Feature typed by a Structure (see also 8.3.3.3).

8.4.4.5 Associations Semantics

Abstract syntax reference: 8.3.4.4

Associations

The checkAssociationSpecialization and checkFeatureEndSpecialization require that an Association specialize the base Association *Links::Link* (see 9.2.3.2.3) and that its associationEnds subset *Links::Link::participant*. These constraints essentially require an N-ary Association to have the form (with implicit relationships included):

```
assoc A specializes Links::Link {
    end feature e1 subsets Links::Link::participant;
    end feature e2 subsets Links::Link::participant;
    ...
    end feature eN subsets Links::Link::participant;
}
```

The *Link* instance for an Association is thus a tuple of *participants*, where each participant is a *single* value of an associationEnd of the Association.

As endFeatures, the associationEnds of an Association are given a special semantics compared to other Features. Even if an associationEnd has a declared multiplicity other than 1..1, the associationEnd is required to effectively have multiplicity 1..1 as a participant in the *Link*. Note that the Feature

Link::participant is declared **readonly**, meaning that the *participants* in a link cannot change once the link is created.

If an associationEnd has a declared multiplicity other than 1..1, then this shall be interpreted as follows: For an Association with *N* associationEnds, consider the *i*-th associationEnd e_i. The multiplicity, ordering and uniqueness constraints specified for e_i apply to each set of instances of the Association that have the same (singleton) values for each of the *N-1* associationEnds other than e_i.

For example, each instance of the Association

```
assoc Ternary {
    end feature a[1];
    end feature b[0..2];
    end feature c[*] nonunique ordered;
}
```

consists of three participants, one value for each of the associationEnds *a*, *b* and *c*. The multiplicities specified for the associationEnds then assert that:

1. For any specific values of *b* and *c*, there must be exactly one instance of *Ternary*, with the single value allowed for *a*.
2. For any specific values of *a* and *c*, there may be up to two instances of *Ternary*, all of which must have different values for *b* (default uniqueness).
3. For any specific values of *a* and *b*, there may be any number of instance of *Ternary*, which are ordered and allow repeated values for *c*.

The checkFeatureEndRedefinition constraint requires that, if an Association has an ownedSubclassification to another Association, then its associationEnds redefine the associationEnds of the superclassifier Association. In this case, the subclassifier Association will indirectly specialize *Link* through a chain of Subclassifications, and each of its associationEnds will indirectly subset *Links::participant* through a chain of redefinitions and a subsettings.

The checkAssociationBinarySpecialization constraint requires that a binary Association (one with exactly two associationEnds) specialize *Links::BinaryLink*. *BinaryLink* specializes *Link* to have exactly two *participants* corresponding to two ends called *source* and *target*. As required by the checkAssociationEndRedefinition constraint, the first associationEnd of a binary Association will the redefine *Links::BinaryLink::source* and its second associationEnd will redefine *Links::BinaryLink::target*.

```
assoc B specializes Links::BinaryLink {
    end feature e1 redefines Links::BinaryLink::source;
    end feature e2 redefines Links::BinaryLink::target;
}
```

Table 14. Associations Implied Relationships

Semantic Constraint	Implied Relationship	Target
checkAssociation Specialization	Subclassification	*Links::Link* (see 9.2.3.2.3)
checkAssociationBinary Specialization	Subclassification	*Links::BinaryLink* (see 9.2.3.2.1)
checkFeatureEnd Specialization	Subsetting	*Links::Link::participant* (see 9.2.3.2.3)

Semantic Constraint	Implied Relationship	Target
checkFeatureEndRedefinition	Redefinition	endFeatures of supertypes of the owning Association of the Feature

Notes

1. The checkFeatureEndSpecialization and checkFeatureEndRedefinition constraints apply to Features that are associationEnds (see also 8.3.3.3).

Association Structures

An AssociationStructure is both an Association and a Structure and, therefore, the semantic constraints of both Associations and Structures (see 8.4.4.4) apply to AssociationStructures. The checkAssociationStructureSpecialization constraint requires an AssociationStructure to specialize Objects::LinkObject (see 9.2.5.2.5), which specializes both *Links::Link* and an *Objects::Object*. The checkAssociationStructureBinarySpecialization constraint requires a binary AssociationStructure to specialize Objects::BinaryLinkObject (see 9.2.5.2.1), which specializes both *Links::BinaryLink* and an *Objects::LinkObject*.

Table 15. Association Structures Implied Relationships

Semantic Constraint	Implied Relationship	Target
checkAssociationStructure Specialization	Subclassification	*Objects::LinkObject* (see 9.2.5.2.5)
checkAssociationStructure BinarySpecialization	Subclassification	*Objects::BinaryLinkObject* (see 9.2.5.2.1)

Notes

1. The general semantic constraints for both Associations and Structures (see 8.4.4.4) also apply to AssociationStructures.

8.4.4.6 Connectors Semantics

Abstract syntax reference: 8.3.4.5

Connectors

A Connector can only be typed by Associations. The checkConnectorSpecialization constraint then requires that Connectors specialize the base Feature *Link::links* (see 9.2.3.2.4), which is typed by the base Association *Links::Link* (see 9.2.3.2.3). Further, the checkFeatureEndRedefinition constraint requires that the connectorEnds of a Connector redefine the associationEnds of its typing Associations. As a result, a Connector typed by an N-ary Association is essentially required to have the form (with implicit relationships included):

```
connector a : A subsets Links::links {
    end feature e1 redefines A::e1 references f1;
    end feature e2 redefines A::e2 references f2;
    ...
    end feature eN redefines A::eN references fN;
}
```

where *e1*, *e2*, ..., *eN* are the names of associationEnds of the Association *A*, in the order they are defined in *A*, and the *f1*, *f2*, ..., *fN* are the relatedFeatures of the Connector. Multplicities declared for connectorEnds have the same special semantics as for associationEnds (see 8.4.4.5). If *A* is an AssociationStructure, then the Connector subsets *Objects::linkObjects* (see 9.2.5.2.6) instead of *Links::link*.

A binary Connector is a Connector with exactly two connectorEnds, that is, a Connector typed by a binary Association. The checkConnectorBinarySpecialization constraint requires that binary Connectors specialize the base Feature *Link::binaryLinks* (see 9.2.3.2.2), which is typed by the Association *Links::BinaryLink* (see 9.2.3.2.1). In particular, if no type is explicitly declared for a binary Connector, then its connectorEnds simply redefine the *source* and *target* ends of the Association *BinaryLink*, which are inherited by the Feature *binaryLinks*.

```
connector b : B subsets Links::binaryLinks {
    end feature source redefines B::source references f1;
    end feature target redefines B::target references f2;
}
```

If *B* is an AssociationStructure, then the Connector subsets *Objects::binaryLinkObjects* (see 9.2.5.2.2) instead of *Links::binaryLinks*.

A Connector therefore specifies a subset of the *Links* of its typing Associations for which the *participants* are values of the relatedFeatures of the Connector. In addition, the checkConnectorTypeFeaturing constraint requires that the featuringTypes of a Connector be consistent with those of its relatedFeatures. Typically, a Connector will have an owningType that is its featuringType, in which case all of its relatedFeatures must also be featured in the context of this Type. An implicit TypeFeaturing may be included to satisfy the checkConnectorTypeFeaturing constraint, but *only* if the Connector has no explicit owningType or ownedTypeFeaturings. The primary case in which an implicit TypeFeaturing is necessary is for a BindingConnector that is itself added implicitly for a FeatureValue (see 8.3.4.10.2).

```
// This is the simplest case of a Connector satisfying checkConnectorTypeFeaturing,
// in which the Connector and its relatedFeatures all have the same owningType.
classifier C {
    feature f1;
    feature f2;
    connector b subsets Links::binaryLinks {
        end feature redefines source references f1;
        end feature redefines target references f2;
    }
}
```

Table 16. Connectors Implied Relationships

Semantic Constraint	Implied Relationship	Target
checkConnectorSpecialization	Subsetting	*Links::links* (see 9.2.3.2.4)
checkConnectorBinary Specialization	Subsetting	*Links::binaryLinks* (see 9.2.3.2.2)
checkConnectorObject Specialization	Subsetting	*Objects::linkObjects* (see 9.2.5.2.6)
checkConnectorBinaryObject Specialization	Subsetting	*Objects::binaryLinkObjects* (see 9.2.5.2.2)

Semantic Constraint	Implied Relationship	Target
checkConnectorTypeFeaturing	TypeFeaturing	The common directly or indirectly featuring Type for the Connector and its relatedElements
checkFeatureEndRedefinition	Redefinition	endFeatures of supertypes of the owning Connector of the Feature

Notes

1. An implied TypeFeaturing shall only be included to satisfy the checkConnectorTypeFeaturing constraint if the Connector has no owningType and no ownedTypeFeaturings.
2. The checkFeatureEndRedefinition constraint applies to Features that are connectorEnds (see also 8.3.3.3).

Binding Connectors

The checkBindingConnectorSpecialization constraint requires that BindingConnectors specialize the Feature *Links::selfLinks* (see 9.2.3.2.6), which is typed by the Association *SelfLink* (see 9.2.3.2.5). *SelfLink* has two associationEnds that subset each other, meaning they identify the same things (have the same values), which then also applies to BindingConnector connectorEnds that redefine the associationEnds of *SelfLink*. Since both associationEnds of *SelfLink* have multiplicity 1..1, both connectorEnds of a BindingConnector do also.

```
binding subsets Links::selfLinks {
    end feature thisThing redefines Links::SelfLink::thisThing references f1;
    end feature thatThing redefines Links::SelfLink::thatThing references f2;
}
```

Table 17. Binding Connectors Implied Relationships

Semantic Constraint	Implied Relationship	Target
checkBindingConnector Specialization	Subsetting	*Links::selfLinks* (see 9.2.3.2.6)

Notes

1. The checkBindingConnectorSpecialization constraint implies that a BindingConnector will always be typed by the Association *Links::SelfLink* (see 9.2.3.2.5), or a specialization of it.
2. The general semantic constraints for Connectors also apply to BindingConnectors.

Successions

The checkSuccessionSpecialization constraint requires that Successions specialize the Feature *Occurrences::happensBeforeLinks* (see 9.2.4.2.2), which is typed by the Association *HappensBefore* (see 9.2.4.2.1). *HappensBefore* (see 9.2.4.2.1) has two associationEnds, asserting that the *Occurrence* identified by its first associationEnd (earlierOccurrence) temporally precedes the one identified by its second (laterOccurrence), which then also applies to Succession connectorEnds that redefine the associationEnds of *HappensBefore*.

```
succession subsets Occurrences::happensBeforeLinks {
    end feature earlierOccurrence references f1
```

```
        redefines Occurrences::HappensBefore::earlierOccurrence;
    end feature laterOccurrence references f2
        redefines Occurrences::HappensBefore::laterOccurrence;
}
```

Table 18. Successions Implied Relationships

Semantic Constraint	Implied Relationship	Target
checkSuccession Specialization	Subsetting	*Occurrences::happensBeforeLinks* (see 9.2.4.2.2)

Notes

1. The checkSuccessionSpecialization constraint implies that a Succession will always be typed by the Association *Occurrences::HappensBefore* (see 9.2.4.2.1), or a specialization of it.
2. The general semantic constraints for Connectors also apply to Successions.

8.4.4.7 Behaviors Semantics

Abstract syntax reference: 8.3.4.6

Behaviors

The checkBehaviorSpecialization constraint requires that Behaviors specialize *Performances::Performance* (see 9.2.6.2.13). In addition, the checkFeatureParameterRedefinition constraint requires that any parameters (i.e., directed Features) of a Behavior redefine corresponding parameters of any other Behaviors it specializes.

```
behavior B specializes Performances::Performance {
    in feature x[0..*];
    out feature y[0..1];
    inout feature z;
}
behavior B1 specializes B {
    in feature x1[1] redefines x;
    out feature y1[1] redefines y;
    // z is inherited without redefinition
}
```

Table 19. Behaviors and Steps Implicit Relationships

Semantic Constraint	Implied Relationship	Target
checkBehaviorSpecialization	Subclassification	*Performances::Performance* (see 9.2.6.2.13)
checkFeatureParameter Redefinition	Redefinition	parameters of supertypes of the owning Behavior of the Feature

Notes

1. The checkFeatureParameterRedefinition constraint applies to Features that are parameters (see also 8.3.3.3).

Steps

The checkStepSpecialization constraint requires that Steps specialize *Performances::performances* (see 9.2.6.2.14). In addition, the checkFeatureParameterRedefinition constraint requires that any parameters (i.e., directed Features) of a Steps redefine corresponding parameters of any other Steps or Behaviors it specializes. In particular, a Step explicitly typed by a Behavior will generally redefine the parameters of that Behavior.

```
step b : B subsets Performances::performances {
    in feature x redefines B::x = x1;
    out feature y redefines B::y;
    inout feature z redefines B::z := z1 ;
}

step b1 : B1 subsets s {
    in feature x redefines B1::x, s::x;
    out feature y redefines B2::y, s::y;
}
```

Further, the checkStepEnclosedPerformanceSpecialization and checkStepSubperformanceSpecialization constraints require that a Step whose owningType is a Behavior or another Step to specialize *Performances::Performance::enclosedPerformance* or, if it is composite, *Performances::Performance::subPerformance*. Finally, the checkStepOwnedPerformanceSpecialization constraint requires that a Step whose owningType is a Structure or a Feature typed by a Structure to specialize *Objects::Object::ownedPerformance*.

```
step s subsets Performances::performances {
    step s1 subsets Performances::Performance::enclosedPerformance;
    composite step s2 subsets Performances::Performance::subperformance;
}
struct S specializes Objects::Object {
    step ss subsets Objects::Object::ownedPerformance;
}
```

Table 20. Steps Implicit Relationships

Semantic Constraint	Implied Relationship	Target
checkStepSpecialization	Subsetting	*Performances::performances* (see 9.2.6.2.14)
checkStepEnclosedPerformance Specialization	Subsetting	*Performances::Performance::enclosedPerformance* (see 9.2.6.2.13)
checkStepSubperformance Specialization	Subsetting	*Performances::Performance::subperformance* (see 9.2.6.2.13)
checkStepOwnedPerformance Specialization	Subsetting	*Objects::Object::ownedPerformance* (see 9.2.5.2.7)
checkFeatureParameter Redefinition	Redefinition	parameters of supertypes of the owning Step of the Feature

Notes

1. The checkStepEnclosedPerformanceSpecialization constraint applies to Steps whose owningType is a Behavior or another Step.

2. The checkStepSubperformanceSpecialization constraint applies to composite Steps whose owningType is a Behavior or another Step.
3. The checkStepOwnedPerformanceSpecialization constraint applies to Steps whose owningType is a Structure or a Feature that is typed by a Structure.
4. The checkFeatureParameterRedefinition constraint applies to Features that are parameters (see also 8.3.3.3).

8.4.4.8 Functions Semantics

Abstract syntax reference: 8.3.4.7

Functions

Functions are kinds of Behaviors. The checkFunctionSpecialization constraint requires that Functions specialize the base Function *Performances::Evaluation* (see 9.2.6.2.3), which is a specialization of *Performances::Performance*. All other semantic constraints on Behaviors (see 8.4.4.7) also apply to Functions. In addition, the checkFeatureResultRedefinition constraint requires that the result parameter of a Function always redefine the result of any its supertypes that are also Functions, regardless of their parameter position.

```
function F specializes Performances::Evaluation {
    in a;
    in b;
    return result redefines Performances::Evaluation::result;
}
function G specializes F {
    in a redefines F::a;
    return result redefines F::result;
    in b redefines F::b;
}
```

Further, if a Function owns an Expression via a ResultExpressionMembership, then the checkFunctionResultBindingConnector constraint requires that the Function have, as an ownedFeature, a BindingConnector between the result parameter of the Expression and the result parameter of the Function.

```
function H specializes Performances::Evaluation {
    return redefines Performances::Evaluation::result;
    binding result = resultExpr.result; // Implicit
    resultExpr
}
```

where the where *resultExpr* is an arbitrary Expression and *resultExpr*.result represents a Feature chain to the Expression result.

A Predicate is a kind of Function, so all semantic constraints for Functions also apply to Predicates. In addition, the checkPredicateSpecialization constraint requires that Predicates specialize the base Predicate *Performances::BooleanEvaluation* (see 9.2.6.2.1), which is a specialization of *Performances::Evaluation*. *BooleanEvaluation* has a result parameter typed by Boolean, so Predicates always have a Boolean result.

```
predicate P specializes Performances::BooleanEvaluation {
    in x : ScalarValues::Real;
    return redefines Performances::BooleanEvaluation::result;
    x > 0
}
```

Table 21. Functions Implied Relationships

Semantic Constraint	Implied Relationship	Target
checkFunctionSpecialization	Subclassification	*Performances::Evaluation* (see 9.2.6.2.3)
checkPredicateSpecialization	Subclassification	*Performances::BooleanEvaluation* (see 9.2.6.2.1)
checkFunctionResultBindingConnector	BindingConnector	From the result of the result Expression of the Function to its result parameter.
checkFeatureResultRedefinition	Redefinition	result parameters of supertypes of the owning Function of the Feature

Notes

1. The checkFeatureResultRedefinition constraint applies to Features that are results (see also 8.3.3.3).
2. The semantic constraints for Behaviors (see 8.4.4.7) also apply to Functions.

Expressions

Expressions are kinds of Steps. The checkExpressionSpecialization constraint requires that Expressions specialize the base Expression *Performances::evaluation*s (see 9.2.6.2.3), which is a specialization of *Performances::performances*. All other semantic constraints on Steps (see 8.4.4.7) also apply to Functions. In addition, the checkFeatureResultRedefinition constraint requires that the result parameter of an Expression always redefine the result of any its supertypes that are Functions or other Expressions, regardless of their parameter position.

```
expr f : F subsets Performances::evaluations {
    in a redefines F::a;
    in b redefines F::b;
    return result redefines F::result, Performances::Evaluation::result;
}
expr g : G subsets f {
    return result redefines f::result;
}
```

Further, if an Expression owns another Expression via a ResultExpressionMembership, then the checkExpressionResultBindingConnector constraint requires that the Expression have, as an ownedFeature, a BindingConnector between the result parameter of the owned Expression and the result parameter of the owning Expression.

```
expr h subsets Performances::Evaluation {
    binding result = resultExpr.result; // Implicit
    resultExpr
}
```

where the where *resultExpr* is an arbitrary Expression and *resultExpr*.result represents a Feature chain to the Expression result.

A BooleanExpression is a kind of Expression, so all semantic constraints for Expressions also apply to BooleanExpressions. In addition, the checkBooleanExpressionSpecialization constraint requires that BooleanExpressions specialize the base BooleanExpression *Performances::booleanEvaluations* (see 9.2.6.2.2), which is a specialization of *Performances::evaluation*s.

```
expr p : P subsets Performances::booleanEvaluations {
    in x : ScalarValues::Integer redefines P::x;
    return redefines P::x, Performance::BooleanEvaluation::result;
}
```

An Invariant is a kind of BooleanExpression, so all semantic constraints for BooleanExpressions also apply to Invariants. In addition, the checkInvariantSpecialization constraint requires that Invariants specialize *either* the BooleanExpression *Performances::trueEvaluations* (see 9.2.6.2.2) or, if the Invariant is negated, BooleanExpression *Performances::falseEvaluations* (see 9.2.6.2.2), both of which are specializations of *Performances::booleanEvaluation*s. The BooleanExpression *trueEvaluations* has its result bound to true, while the BooleanExpression *falseEvaluations* has its result bound to false.

```
inv true i1 subsets Performances::trueEvaluations {
    p(3)
}
inv false i2 subsets Performances::falseEvaluations {
    p(-3)
}
```

Table 22. Expressions Implied Relationships

Semantic Constraints	Implied Relationship	Target
checkExpression Specialization	Subsetting	*Performances::evaluations* (see 9.2.6.2.4)
checkBooleanExpression Specialization	Subsetting	*Performances::booleanEvaluations* (see 9.2.6.2.2)
checkInvariantSpecialization	Subsetting	*Performances::trueEvaluations* (see 9.2.6.2.16), for true Invariants, or *Performances::falseEvaluations* (see 9.2.6.2.5), for false (negated) Invariants
checkExpressionResult BindingConnector	BindingConnector	From the result of the result Expression of the owning Expression to its result parameter.
checkFeatureResult Redefinition	Redefinition	result parameters of supertypes of the owning Expression of the Feature

Notes

1. The checkFeatureResultRedefinition constraint applies to Features that are results (see also 8.3.3.3).

2. The semantic constraints for `Steps` (see 8.4.4.7) also apply to `Expressions`.

8.4.4.9 Expressions Semantics

Abstract syntax reference: 8.3.4.8

Null Expressions

The `checkNullExpressionSpecialization` constraint requires that `NullExpressions` specialize the `Expression` *`Performances::nullEvaluations`* (see 9.2.6.2.12), which is typed by the `Function` *`Performances::NullEvaluation`* (see 9.2.6.2.11). The `result parameter` of *`NullEvaluation`* has multiplicity `0..0`, which means that a `NullExpression` always produces an empty result.

Table 23. Null Expressions Implied Relationships

Semantic Constraint	Implied Relationship	Target
`checkNullExpression Specialization`	`Subsetting`	*`Performances::nullEvaluations`* (see 9.2.6)

Notes

1. The general semantic constraints for `Expressions` (see 8.4.4.8) also apply to `NullExpressions`.

Literal Expressions

The `checkLiteralExpressionSpecialization` constraint requires that `LiteralExpressions` specialize the `Expression` *`Performances::literalEvaluations`* (see 9.2.6.2.8), which is typed by the `Function` *`Performances::LiteralEvaluation`* (see 8.3.4.8.7). The `result parameter` of *`LiteralEvaluation`* has multiplicity `1..1` and is typed by *`Base::DataValue`* (see 9.2.2.2.2). This means that a `LiteralExpression` always produces a single *`DataValue`* as its result. What value is actually produced depends on the kind of `LiteralExpression`.

With the exception of `LiteralInfinity`, each kind of `LiteralExpression` has a `value` property typed by a UML primitive type [UML, MOF]. The result produced by such a `LiteralExpression` is given by this `value`. `LiteralInfinity` does not have a `value` property, because its result is always "infinity" (written `*` the KerML textual notation; see 8.2.5.8.4), which is a number from the `DataType` *`ScalarValues::Positive`* that is greater than all the integers. The `checkFeatureResultSpecialization` requires that the `result parameter` of a `LiteralExpression` have the corresponding `DataType` from the KerML *`ScalarValues`* library (see 9.3.2), e.g., *`Positive`* for `LiteralInfinity`, *`String`* for `LiteralString`, etc.

Note. In the abstract syntax, the `value` property of `LiteralRational` has type `Real` (see 8.3.4.8.10), because that is the available UML/MOF primitive type. However, only the rational-number subset of the real numbers can be represented using a finite literal. So the result of a `LiteralRational` is actually always classified in the KerML `DataType` *`Rational`*.

Table 24. Literal Expressions Implied Relationships

Semantic Constraint	Implied Relationship	Target
`checkLiteralExpression Specialization`	`Subsetting`	*`Performances::literalEvaluations`* (see 9.2.6)

Semantic Constraint	Implied Relationship	Target
checkFeatureResult Specialization	FeatureTyping	The DataType from *ScalarValues* (see 9.3.2) corresponding to the kind of the owning LiteralExpression

Note

1. The checkFeatureResultSpecialization constraint applies to Features that are the result parameter of a LiteralExpression (see also 8.4.3.4).
2. The general semantic constraints for Expressions (see 8.4.4.8) also apply to LiteralExpressions.

Feature Reference Expressions

There is no specific specialization requirement for a FeatureReferenceExpression. However, the general checkExpressionSpecialization constraint (see 8.4.4.8) requires that a FeatureReferenceExpression specialize *Performances::Evaluation* (see 9.2.6.2.3). All other general semantic constraints for Expressions also apply to FeatureReferenceExpressions.

A FeatureReferenceExpression is parsed with a non-owning Membership relationship to its referent Feature (see 8.2.5.8.3). The checkFeatureReferenceExpressionBindingConnector constraint then requires that there be a BindingConnector between this member Feature and the result parameter of the FeatureReferenceExpression. The checkFeatureResultSpecialization constraint then requires that the result parameter also subset the Feature. While this subsetting is technically implied by the semantics of the BindingConnector (see 8.4.4.6), including the Subsetting relationship allows for simpler static type checking of the result of the FeatureReferenceExpression.

Given the above, a FeatureReferenceExpression whose referent is a Feature f is semantically equivalent the Expression

```
expr subsets Performances::evaluations {
    member feature f;
    return result
        redefines Performances::Evaluation::result
        subsets f;
    binding result = f;
}
```

A body Expression (see 8.2.5.8.3) is parsed as a FeatureReferenceExpression that contains the Expression body as its *owned* referent. That is, a body Expression of the form

```
{ body }
```

is semantically equivalent to

```
expr subsets Performances::evaluations {
    expr e subsets Performances::evaluation { body }
    return result
        redefines Performances::Evaluation::result
        subsets e;
    binding result = e;
}
```

This means that the result of the Expression is the *Evaluation* of the body Expression itself, rather than the result of actually evaluating the body. If and when this *Evaluation* actually occurs can then be further constrained, e.g., within an invoked Function for which the body Expression is an argument (as done, for example, by *ControlFunctions* – see below).

Table 25. Feature Reference Expressions Implied Relationships

Semantic Constraint	Implied Relationship	Target
checkFeatureReference ExpressionBindingConnector	BindingConnector	Between the referent and result of the FeatureReferenceExpression
checkFeatureResult Specialization	Subsetting	The referent of the owning FeatureReferenceExpression of the Feature

Notes

1. The checkFeatureResultSpecialization constraint applies to Features that are the result parameter of a FeatureReferenceExpression (see also 8.4.3.4).
2. The general semantic constraints for Expressions (see 8.4.4.8) also apply to FeatureReferenceExpressions.

Invocation Expressions

An InvocationExpression of the form *F(e1, e2, ...)*, where *F* is the name of function and *e1, e2,* ... are argument Expressions, is parsed with a FeatureTyping relationship to *F* and input parameters that have FeatureValue relationships to the arguments (see 8.2.5.8.3). There is no specific specialization requirement for an InvocationExpression. However, the general semantic constraints for Expressions also apply to InvocationExpressions. Thus, an InvocationExpression of this form is semantically equivalent to

```
expr : F subsets Performances::Evaluation {
    in a redefines F::a = e1;
    in b redefines F::b = e2;
    ...
    return result redefines F::result;
}
```

The semantic constraints for FeatureValues then require that each parameter is bound to the result of the corresponding expression (i.e., *a* is bound to *e1.result,* etc.). Thus, an InvocationExpression represents an Evaluation of the Function *F* with inputs corresponding to the results of evaluating the argument Expressions, producing result values in its result output parameter.

If *F* names a Feature, or is a Feature chain, the semantics are similar, except that the InvocationExpression has a Subsetting relationship with *F,* instead of a FeatureTyping relationship. If the named-argument notation is used, then the InvocationExpression parameters redefine the named parameters of *F,* regardless of order.

See also 8.4.4.11 on the semantic requirements for binding default FeatureValues in InvocationExpressions.

Operator Expressions

An OperatorExpression is an InvocationExpression in which the invoked Function is identified by an operator symbol. The checkOperatorExpressionSpecialization constraint requires that this Function be

the resolution of the operator symbol as a name in one of the library Packages *BaseFunctions*, *DataFunctions* or *ControlFunctions*.

With the exception of operators for *ControlFunctions* (see below), the concrete syntax for OperatorExpressions (see 8.2.5.8.1) is thus essentially just a special surface syntax for InvocationExpressions of the standard library Functions identified by their operator symbols. For example, a unary OperatorExpression such as

```
not expr
```

is equivalent to the InvocationExpression

```
DataFunctions::'not' (expr)
```

and a binary OperatorExpression such as

```
expr_1 + expr_2
```

is equivalent to the InvocationExpression

```
DataFunctions::'+' (expr_1, expr_2)
```

where these InvocationExpressions are then semantically interpreted as described above.

The + and – operators are the only operators that have both unary and binary usages. However, the corresponding library Functions have optional 0..1 multiplicity on their second parameters, so it is acceptable to simply not provide an input for the second argument when mapping the unary usages of these operators.

Functions in the library models *BaseFunctions* and *ScalarFunctions* are extensively specialized in other library models to constrain their parameter types (e.g., the Package *RealFunctions* constrains parameter types to be *Real*, etc.). The result values the evaluation of such a Function shall be determined by the most specialized of its subtypes that is consistent with the types of its the dynamics result values from evaluating its argument Expressions.

Certain OperatorExpressions denote invocations of Functions in the *ControlFunctions* library model (see 9.4.17) that have one or more parameters that are Expressions. In the concrete syntax for such OperatorExpressions (see 8.2.5.8.1), the arguments corresponding to these parameters are parsed as if they were body Expressions (as described under "Feature Reference Expressions" above), so they can effectively be passed without being immediately evaluated.

The second and third arguments of the ternary conditional test operator **if** are for Expression parameters. Therefore, the notation for a conditional test OperatorExpression of the form

```
if expr_1 ? expr_2 else expr_3
```

is parsed as

```
ControlFunctions::'if' (expr_1, { expr_2 }, { expr_3 })
```

The second arguments of the binary conditional logical operators **and**, **or**, and **implies** are for Expression parameters. Therefore, the notation for a conditional logical OperatorExpression of the form

```
expr_1 and expr_2
```

is parsed as

```
ControlFunctions::'and' (expr_1, { expr_2 })
```

and similarly for **`or`** and **`implies`**.

Table 26. Operator Expressions Implied Relationships

Semantic Constraint	Implied Relationship	Target
`checkOperatorExpression Specialization`	`FeatureTyping`	The library `Function` named by the `operator` of the `OperatorExpression`

Notes

1. The general semantic constraints for `Expressions` (see 8.4.4.9) also apply to `OperatorExpressions`.

Metadata Access Expressions

The `checkMetadataAccessExpressionSpecialization` constraint requires that a `MetadataAccessExpression` specialize the `Expression` *`Performances::metadataAccessEvaluations`* (see 9.2.6.2.10), which is typed by the `Function` *`Performances::MetadataAccessEvaluation`* (see 9.2.6.2.9). The `result parameter` of *`MetadataAccessEvaluation`* is ordered and typed by *`Metaobjects::Metaobject`* (see 9.2.16.2.1). This means that a `MetadataAccessExpression` evaluates to an ordered set of *`Metaobjects`*, which are determined as follows:

- A *`Metaobject`* representing each `MetadataFeature` (see 8.3.4.12.3) owned by the `referencedElement` of the `MetadataAccessExpression` that has the `referenceElement` as an `annotatedElement`, in the order that the `MetadataFeatures` appear in the model. Each of these *`Metaobjects`* is an instance of the `metaclass` of the corresponding `MetadataFeature`, with the `features` of each instance having values determined by evaluating the bound `Expressions` of the `features` in the `MetadataFeature` as model-level evaluable `Expressions` (see below).
- Followed by a *`Metaobject`* that is an instance of the `Metaclass` from the reflective *`KerML`* abstract syntax library model (see 9.2.17) corresponding to the MOF metaclass of the `referencedElement` of the `MetadataAccessExpression`, with `features` having values corresponding to the values of the MOF properties for the `referencedElement`.

Note that every `Metaclass` is required to specialize *`Metaobjects::Metaobject`*, so the typing of the results of a `MetadataAccessExpression` is consistent.

For example, the `MetadataAccessExpression` *`C.`***`metadata`** for the following `referencedElement`:

```
class C {
    metadata M;
}
```

would evaluate to two *`Metaobjects`*: an instance of the `Metaclass` *`M`* representing the `MetadataFeature` annotation on *`C`* and an instance of *`KerML::Class`* representing the `referencedElement` *`C`* itself.

Table 27. Metadata Access Expressions Implied Relationships

Semantic Constraint	Implied Relationship	Target
`checkMetadataAccess ExpressionSpecialization`	`Subsetting`	*`Performances::metadataAccessEvaluations`* (see 9.2.6.2.10)

Notes

1. The general semantic constraints for `Expressions` (see 8.4.4.9) also apply to `MetadataAccessExpressions`.

Model-Level Evaluable Expressions

A model-level evaluable `Expression` is an `Expression` that can be evaluated using metadata available within a model itself. This means that the evaluation rules for such an `Expression` can be defined entirely within the abstract syntax. A model-level evaluable `Expression` is evaluated on a given *target* `Element` (see 8.4.4.13 and 8.4.4.14 for the targets used in the case of metadata `values` and `filterConditions`, respectively), using the `Expression::evaluate` operation, resulting in an ordered list of `Elements`. The rules for this operation are specified in the abstract syntax (see 8.3.4.8) and are summarized below:

1. A `NullExpression` evaluates to the empty list.
2. A `LiteralExpression` evaluates to itself.
3. A `FeatureReferenceExpression` is evaluated by first determining a value `Expression` for the `referent`:
    - If the `target` `Element` is a `Type` that has a `feature` that is the `referent` or (directly or indirectly) redefines it, then use the `value` `Expression` of the `FeatureValue` for that `feature` (if any).
    - Else, if the `referent` has no `featuringTypes`, then use the `value` `Expression` of the `FeatureValue` for the `referent` (if any).

    Then:
    - If such a value `Expression` exists, the `FeatureReferenceExpression` evaluates to the result of evaluating that `Expression` on the `target`.
    - Else, if the `referent` is not an `Expression`, the `FeatureReferenceExpression` evaluates to the `referent`.
    - Else, the `FeatureReferenceExpression` evaluates to the empty list.
4. A `MetadataAccessExpression` evaluates to the `ownedElements` of the `referencedFeature` that are `MetadataFeatures` and have the `referencedElement` as an `annotatedElement`, plus a `MetadataFeature` whose `annotatedElement` is the `referencedElement`, whose `metaclass` is the reflective `Metaclass` in the *KerML* library model (see 9.2.17) corresponding to the MOF class of the `referencedElement`, and whose `ownedFeatures` are bound to the values of the MOF properties of the `referencedElement`.
5. An `InvocationExpression` evaluates to an application of its `function` to argument values corresponding to the results of evaluating each of the `argument` `Expressions` of the `InvocationExpression`, with the correspondence as given below.

Every `Element` in the list resulting from a model-level evaluation of an `Expression` according to the above rules will be either a `LiteralExpression` or a `Feature` that is not an `Expression`. If each of these `Elements` is further evaluated according to its regular instance-level semantics, then the resulting list of instances will correspond to the result that would be obtained by evaluating the original `Expression` using its regular semantics on the referenced metadata of the target `Element`.

8.4.4.10 Interactions Semantics

Abstract syntax reference: 8.3.4.9

Interaction Semantics

An `Interaction` is both an `Association` and a `Behavior`, and, therefore, the semantic constraints for both `Associations` (see 8.4.4.5) and `Behaviors` (see 8.4.4.7) apply. In particular, the

checkAssociationSpecialization constraint requires that an Interaction specialize *Links::Link* (see 9.2.3.2.3), or, if it is a binary Interaction (with exactly two end Features), the checkAssociationBinarySpecialization constraint requires that it specializes *Links::BinaryLink* (see 9.2.3.2.1). And the checkBehaviorSpecialization constraint requires that it also specialize *Performances::Performance* (see 9.2.6.2.13).

These constraints require an N-ary Interaction to have the form (with implicit relationships included)

```
interaction I specializes Link::Link, Performances::Performance {
    end feature e1 subsets Links::Link::participant;
    end feature e2 subsets Links::Link::participant;
    ...
    end feature eN subsets Links::Link::participant;
}
```

with a binary Interaction having the form

```
interaction B specializes Links::BinaryLink, Performances::Performance {
    end feature e1 redefines Links::BinaryLink::source;
    end feature e2 redefines Links::BinaryLink::target;
}
```

The checkFeatureEndRedefinition and checkFeatureParameterRefinition constraints also apply to Interactions.

```
interaction I1 specializes Links::BinaryLink, Performances::Performance {
    in feature x1;
    out feature y1;

    end feature e1;
    end feature f1;
}
interaction I2 specializes I1 {
    in feature x2 redefines x1;
    out feature y2 redefines y1;

    end feature e2 redefines e1;
    end feature f2 redefines f1;
}
```

Item Flow Semantics

An ItemFlow is both a Connector and a Step and, therefore, the semantics constraints for both Connectors (see 8.4.4.6) and Steps (see 8.4.4.7) also apply to ItemFlows. In addition, the checkItemFlowSpecialization constraint requires that ItemFlows specialize *Transfers::transfers* (see 9.2.7.2.11).

The textual notation for an ItemFlow, of the form

```
flow of i : T from f1.f1_out to f2.f2_in;
```

is parsed with *i : T* as an ItemFeature and having two ItemFlowEnds, one referencing *f1* with an owned Feature redefining *f1_out* and one referencing *f2* with an owned Feature redefining *f2_in* (see 8.2.5.9.2). An ItemFlowFeature is just a Feature owned by an ItemFlow that has the special semantic constraint checkItemFeatureRedefinition that requires that an ItemFeature redefine *Transfers::Transfer::item* (see 9.2.7.2.9). An ItemFlowEnd is an end Feature owned by an ItemFlow that is required to have a single ownedFeature. The general checkFeatureEndRedefinition constraint (see 8.4.4.6) requires that the two

ItemFlowEnds of an ItemFlow redefine *Transfers::Transfer::source* and *Transfers::Transfer::target* (see 9.2.7.2.9), respectively. The checkFeatureItemFlowFeatureRedefinition constraint then requires that the ownedFeatures of the ItemFlowEnds redefine *Transfer::source::sourceOutput* or *Transfer::target::targetInput*.

```
flow subsets Transfers::transfers {
    // ItemFeature
    feature i : T redefines item;

    // First ItemFlowEnd
    end feature redefines Transfers::Transfer::source references f1 {
        feature redefines Transfers::Transfer::source::sourceOutput, f1_out;
    }

    // Second ItemFlowEnd
    end feature redefines Transfers::Transfer::target references f2 {
        feature redefines Transfers::Transfer::target::targetInput, f2_in;
    }
}
```

A SuccessionItemFlow is semantically the same, except that the checkSuccessionItemFlowSpecialization constraint requires that it specialize *Transfers::transfersBefore*.

Table 28. Item Flows Implied Relationships

Semantic Constraint	Implied Relationship	Target
checkItemFlowSpecialization	Subsetting	*Transfers::transfers* (see 9.2.7.2.11)
checkSuccessionItemFlow Specialization	Subsetting	*Transfers::transfersBefore* (see 9.2.7.2.12)
checkItemFeature Redefinition	Redefinition	*Transfers::Transfer::item* (see 9.2.7.2.9)
checkFeatureItemFlowFeature Redefinition	Redefinition	*Transfer::source::sourceOutput* or *Transfer::target::targetInput* (see 9.2.7.2.9)

1. The checkFeatureItemFlowEndRedefinition constraint applies to Features that are owned by an ItemFlowEnd (see also 8.4.3.4).
2. The general semantic constraints for Connectors (see 8.4.4.6) and Steps (see 8.4.4.7) also apply to ItemFlows.

8.4.4.11 Feature Values Semantics

Abstract syntax reference: 8.3.4.10

A FeatureValue is a kind of OwningMembership between a Feature and an Expression. Note that the FeatureValue relationship is *not* a Featuring relationship, so its featureWithValue (that is, its owning Feature) is *not* the featuringType of the the value Expression. Instead, the checkExpressionFeaturingType constraint requires that the value Expression have the same featuringTypes as the featureWithValue. Most commonly, if the featureWithValue is an ownedFeature of a Type, this means that the Expression will have that Type as its featuringType.

The checkFeatureValuationSpecialization constraint requires that, if the featureWithValue has no explicit ownedSpecializations and is not directed, then it subsets the result parameter of the value Expression. This reflects the semantics that the values of the featureWithValue is determined by the value Expression, giving the featureWithValue an implied typing that is useful for static type checking. On the other hand, if the featureWithValue has ownedSpecializations or is directed, then its static typing can be considered determined by its declaration excluding the FeatureValue (but including any implied Specializations), which should then be validated against the typing of the result of the value Expression.

If the FeatureValue has isDefault = false, the checkFeatureValueBindingConnector constraint requires that its featureWithValue have an ownedMember that is a BindingConnector between that Feature and the result parameter of the value Expression of the FeatureValue. The general semantic constraints for Connectors (see 8.4.4.6) then apply to this BindingConnector required for a FeatureValue. In particular, if the FeatureValue has isInitial = false, then the checkConnectorTypeFeaturing constraint effectively requires that the featuringTypes of the BindingConnector be the same as those of the featureWithValue. Most commonly, if the featureWithValue is an ownedFeature of a Type, then the BindingConnector will have that Type as its featuringType.

Given the above, the textual notation for a FeatureValue with isDefault = false and isInitial = false, of the form

```
type T {
   feature f = expr;
}
```

is semantically equivalent to

```
type T {
    feature f {
        member expr e featured by T { ... }
        member binding f = e.result featured by T;
    }
}
```

where *e* is the semantic interpretation of *expr* as described in 8.4.4.9.

If a FeatureValue has isDefault = false but isInitial = true, then checkConnectorFeatureTyping does not apply and, instead, the checkBindingConnectorInitialTypeFeaturing constraint requires that the BindingConnector be featured by the *startShot* (see 9.2.4.2.14) of the *that* reference of its owning featureWithValue (see 9.2.2.2.6). Note that this is only possible if the featureWithValue is featured by a Class (see also 8.4.4.3 on the semantics of Classes). Most commonly, if the featureWithValue is an ownedFeature of a Class or a Feature typed by a Class, then the BindingConnector will have the startShot of that Class as its featuringType, meaning that the binding only applies initially, that is, at the very start of an *Occurrence* that is an instance of the Class.

Thus, the textual notation for a FeatureValue with isDefault = false and isInitial = true, of the form

```
class C {
   feature f := expr;
}
```

is semantically equivalent to

```
class C {
    feature f {
        member expr e featured by C { ... }
```

```
            member binding f = e.result featured by f.that.startShot;
        }
    }
```

(note that the *that* is considered to be implicitly typed by *Occurrence* in this case).

If a FeatureValue has isDefault = true, then no BindingConnector is added to the featureWithValue at its point of declaration. Instead, the checkInvocationExpressionDefaultValueBindingConnector constraint requires that a BindingConnector shall be added for a FeatureValue with isDefault = true if it is the *effective default value* for a Feature of the invoked Type of an InvocationExpression, defined as follows:

- If the Feature has an owned FeatureValue with isDefault = true, then this is its effective default value.
- If the Feature does not have an owned FeatureValue, but the set of effective default values of the Features it redefines has a single unique member, then this is the effective default value of the original Feature.
- Otherwise the Feature does not have an effective default value.

For example, given the Type declaration

```
type T {
   feature f default = e;
}
```

a binding for f is included for the invocation T(), which is then semantically equivalent to

```
expr : T {
    feature redefines f {
        member binding f = e.result featured by T;
    }
}
```

where *e.result* is the result of the inherited value Expression from the default FeatureValue. On the other hand, for the invocation T(f = 1), the Feature *f* will be bound to 1 rather than the FeatureValue default. A similar construction applies for FeatureValues with isDefault = true and isInitial = true. (See also 8.4.4.9 on the general semantics of InvocationExpressions.)

Table 29. Feature Values Implied Relationships

Semantic Constraint	Implied Relationship	Target
checkFeatureValue BindingConnector	BindingConnector	Between the featureWithValue of the FeatureValue and the result of its value Expression
checkFeatureValuation Specialization	Subsetting	The result of the value Expression of an owned FeatureValue of a Feature
checkExpressionTypeFeaturing	FeaturingType	The featuringTypes of the featureWithValue of the FeatureValue that owns the Expression

Semantic Constraint	Implied Relationship	Target
checkBindingConnectorInitialTypeFeaturing	TypeFeaturing	A Feature chain consisting of the owning Feature, things::that (see 9.2.2.2.6), and Occurrences::startShot (see 9.2.4.2.14)

Notes

1. The checkFeatureValuationSpecialization constraint applies to a Feature that owns a FeatureValue relationship (see also 8.4.3.4).
2. The checkExpressionTypeFeaturing constraint applies to an Expression that is the value Expression of a FeatureValue relationship.
3. The checkBindingConnectorInitialTypeFeaturing constraint applies to an implied BindingConnector resulting from the checkFeatureValueBindingConnector constraint, for a FeatureValue with isInitial = true.

8.4.4.12 Multiplicities Semantics

Abstract syntax reference: 8.3.4.11

The checkMultiplicitySpecialization constraint requires that Multiplicities subset the Feature *Base::naturals* (see 9.2.2.2.4), which means that are typed by the DataType *ScalarValues::Natural* (see 9.3.2.2.4) or a specialization of it.

A MultiplicityRange of the form

```
[expr_1.. expr_2]
```

represents a range of values of *Natural* that are greater than or equal to the result of the Expression *expr_1* and less than or equal to the result of the Expression *expr_2*. Essentially, this is equivalent to the result of the Expression

```
all Natural -> select { in n; expr_1 <= n & n <= expr_2 }
```

where, if *expr_2* evaluates to the unbounded value *, all other *Natural* values are less than it.

A MultiplicityRange having only a single expression:

```
[expr]
```

is interpreted in one of the following ways:

- If *expr* evaluates to *, then the values of the MultiplicityRange are the entire extent of *Natural*.
- Otherwise, the values of the MultiplicityRange are all *Natural* values less than or equal to the result of *expr*.

```
all Natural -> select { in n; n <= expr }
```

Note. A conforming tool is not expected to compute the entire set of *Natural* numbers that are values of a MultiplicityRange. It is sufficient to check that the values of a Type have a cardinality that is within the range specified by the MultiplicityRange.

Table 30. Multiplicities Implied Relationships

Semantic Constraint	Implied Relationship	Target
checkMultiplicity Specialization	Subsetting	*Base::naturals* (see 9.2.2.2.4)

8.4.4.13 Metadata Semantics

Abstact syntax reference: 8.3.4.12

Metaclasses

The checkMetaclassSpecialization constraint requires that Metaclasses specialize the base Metaclass *Metaobjects::Metaobject* (see 9.2.16.2.1). A Metaclass is a kind of Structure (see 8.4.4.4), but it's instances are *Metaobjects* that are part of the structure of a model itself, rather than as an instance in the system represented by the model. The *KerML* libary model is a reflective model of the MOF abstract syntax for KerML, containing one KerML Metaclass corresponding to each MOF metaclass in the abstract syntax model (see 9.2.17 for more details on the relationship between the *KerML* model and the abstract syntax).

Table 31. Metaclasses Implied Relationships

Semantic Constraint	Implied Relationship	Target
checkMetaclassSpecialization	Subclassificiation	*Metaobjects::Metaobject* (see 9.2.16.2.1)

Metadata Features

A MetadataFeature is both a Feature typed by a Metaclass and an AnnotatingElement that annotates other Elements in a model. The checkMetadataFeatureSpecialization requires that MetadataFeatures specialize the Feature *Metaobjects::metaobjects* (see 9.2.16.2.2). At a meta-level, a MetadataFeature can be treated as if the reflective Metaclasses of its annotatedElements were its featuringTypes. In this case, the MetadataFeature defines a map from its annotatedElements, as instances of their Metaclasses, to a single instance of the metaclass of the MetadataFeature.

Further, a model-level evaluable Expression is an Expression that can be evaluated using metadata available within a model itself (see 8.4.4.9). If a model-level evaluable Expression is evaluated on such metadata according to the regular semantics of Expressions, then the result will correspond to the static evaluation of the Expression within the model. Therefore, if a MetadataFeature is instantiated as above, the binding of its features to the results of evaluating the model-level evaluable value Expressions of its FeatureValues can be interpreted according to the regular semantics of FeatureValues (see 8.4.4.11) and BindingConnectors (see 8.4.4.6).

When a value Expression is model-level evaluated (as described in 8.4.4.9), its target is the MetadataFeature that owns the featureWithValue. This means that the value Expression for a nested Feature of a MetadataFeature may reference other Features of the MetadataFeature, as well as Features with no featuringTypes or *Anything* as a featuringType.

Table 32. Metadata Features Implied Relationships

Semantic Constraint	Implied Relationship	Target
checkMetadataFeature Specialization	Subsetting	*Metaobjects::metaobjects* (see 9.2.16.2.2)

Semantic Metadata

A *semantic* MetadataFeature is one that directly or indirectly specializes *Metaobjects::SemanticMetadata* (see 9.2.16.2.3) It is used to introduce a user-defined specialization constraint on the Type annotated by the MetadataFeature. *SemanticMetadata* has the Feature *baseType* typed by the reflective Metaclass *KerML::Type* (see 9.2.17) that is redefined by a semantic MetadataFeature. The target of the effective specialization constraint defined by a semantic MetadataFeature is determined by the value bound to its *baseType* feature.

Specifically, for each semantic MetadataFeature annotating a Type, the checkTypeSemanticSpecialization constraint requires that the annotated Type directly or indirectly specialize the Type bound to the *baseType* of the MetadataFeature, *unless* the annotated Type is a Classifier and the *baseType* is a Feature.

For each semantic MetadataFeature annotating a Classifier, the checkClassifierSemanticSpecialization constraint additionally requires that, if the Type bound to the *baseType* of the MetadataFeature is a Feature, then the annotated Classifier shall directly or indirectly specialize each type of the *baseType* Feature.

Table 33. Semantic Metadata Implied Relationships

Semantic Constraint	Implied Relationship	Target
checkTypeSemantic Specialization	Specialization Subclassification Subsetting	The Type bound to the *baseType* of an annotating semantic MetadataFeature
checkClassifierSemantic Specialization	Subclassification	The types of the Feature bound to the *baseType* of an annotating semantic MetadataFeature

Notes

1. The checkTypeSemanticSpecialization constraint applies to any Type with one or more semantic MetadataFeature annotation.
2. The checkClassifierSemanticSpecialization constraint applies to a Classifier with one or more semantic MetadataFeature annotation whose *baseType* value is a Feature.
3. For the checkTypeSemanticSpecialization constraint, the implied relationship is a Subclassification if the annotated Type and the *baseType* are both Classifiers, Subsetting if they are both Features, and just a Specialization otherwise.

8.4.4.14 Packages Semantics

Packages do not have instance-level semantics (they do not affect instances).

The filterConditions of a Package are model-level evaluable Expressions that are evaluated as described in 8.4.4.9. All filterConditions are checked against every Membership that would otherwise be imported into the Package if it had no filterCondition. A Membership shall be imported into the Package if and only if every filterCondition evaluates to true either with no target Element, or with any MetadataFeature of the memberElement of the Membership as the target Element.

9 Model Libraries

9.1 Model Libraries Overview

A *model library* is a collection of library models that can be reused across many user models. KerML includes three standard model libraries: the Semantic Library (see 9.2), the Data Type Library (see 9.3), and the Function Library (see 9.4). The normative machine-readable representation for each of these model libraries is a project interchange file, formatted according to the standard for KerML model interchange given in Clause 10. Each library model is then represented in the textual concrete syntax, packaged as a model interchange file in the project interchange file for its corresponding model library. All of these library models are described for reference in subclauses of this clause.

9.2 Semantic Library

9.2.1 Semantic Library Overview

The Semantic Library is a collection of KerML models that are part of the semantics of the metamodel (see Clause 8). They are reused when constructing KerML user models (instantiating the abstract syntax), as specified by constraints and semantics of metaelements, such as Types being required to specialize *Anything* from the library and Behaviors specializing *Performance* (see 8.4). The library can be specialized for particular applications, such as systems modeling.

The Semantic Library contains a set of packages, one for each library model, as described in a subsequent subclauses. The following are the major areas covered in the Semantic Library.

1. The *Base* library model (see 9.2.2) begins the Specialization hierarchy for all KerML Types, including the most general Classifier *Anything* and the most general Feature *things*. It also contains the most general DataType *DataValue* and its corresponding Feature *dataValues*. The *Links* library model (see 9.2.3) specializes *Base* to provide the semantics for Associations between things.
2. The *Occurrences* library model (see 9.2.4) introduces *Occurrence*, the most general Class of things that exist or happen in time and space, as well as the basic temporal Associations between them. The *Objects* library model (see 9.2.5) specializes *Occurrences* to provide a model of *Objects* and *LinkObjects*, giving semantics to Structures and AssociationStructures, respectively. The *Performances* library model (see 9.2.6) specializes *Occurrences* to provide a model of *Performances* and *Evaluations*, giving semantics to Behaviors and Expressions, respectively. Temporal associations can be used by Successions to specify the order in which *Performances* are carried out during other *Performances*, or when *Objects* exist in relation to each other, or combinations involving *Performances* and *Objects*. The *Transfers* library model (see 9.2.7) models asynchronous flow of items between *Occurrences,* giving semantics to Interactions and ItemFlows. The *FeatureAccessPerformances* library model (see 9.2.8) defines specialized *Performances* for access and modifying the values of features at specific points in time.
3. The *ControlPerformances, TransitionPerformances* and *StatePerformances* library models (see 9.2.9, 9.2.11, and 9.2.10) provide for coordination of multiple *Performances* to carry out some task by using them as types of Steps in an overall containing Behavior. KerML does not provide syntax specific to these library elements (e.g., KerML does not have any "control node" or "state machine" syntax), though it is expected that other languages built on KerML, and using these library models, can add syntax as needed by their applications.

9.2.2 Base

9.2.2.1 Base Overview

This library model begins the Specialization hierarchy for all KerML Types (see 8.3.3.1 and 8.4.3.2), starting with the most general Classifier *Anything*, the `type` of the most general Feature *`things`*, which classify everything in the modeled universe and the relations between them, respectively. Being the most general library elements for their metaclasses means all Classifiers and Features in models, including in libraries, specialize them, respectively. They are specialized into most general DataType *DataValue*, the `type` of *`dataValues`*, the most general Feature typed by DataTypes, respectively (see 8.3.4.1). *DataValues* are *Anything* that can only be distinguished by how they are related to other things (via Features and Assocations). These are further specialized into *Natural* and *`naturals`*, respectively, an extension for mathematical natural numbers (integers zero and greater) extended with a number greater than all the integers ("infinity"), but treated like one, notated as `*` (see 9.3.2.1). The Feature *`self`* of *Anything* relates each thing in the universe to itself only (see *SelfLinks* in 9.2.3.1).

9.2.2.2 Elements

9.2.2.2.1 Anything

Element

Classifier

Description

Anything is the most general Classifier (M1 instance of M2 Classifier). All other M1 elements (in libraries or user models) specialize it (directly or indirectly). Anything is the `type` for `things`, the most general Feature. Since FeatureTyping is a kind of Generalization, this means that Anything is also a generalization of `things`.

General Types

None.

Features

self : Anything {subsets selfSameLife}

The source of a SelfLink of this thing to itself. `self` is thus a feature that relates everything to itself. It is also the value of the nested `that` feature of all other things featured by this thing.

Constraints

None.

9.2.2.2.2 DataValue

Element

DataType

Description

A DataValue is Anything that can only be distinguished by how it isrelated to other things (via Features). DataValue is the most general Datatype (M1 instance of M2 Datatype). All other M1 Datatypes (in libraries or user models) specialize it (directly or indirectly).

General Types

Anything

Features

None.

Constraints

None.

9.2.2.2.3 dataValues

Element

Feature

Description

`dataValues` is a specialization of `things` restricted to type DataValue. All other Features typed by DataValue or its specializations (in libraries or user models) specialize it (directly or indirectly).

General Types

DataValue
things

Features

None.

Constraints

None.

9.2.2.2.4 naturals

Element

Feature

Description

General Types

Natural
dataValues

Features

None.

Constraints

None.

9.2.2.2.5 SelfSameLifeLink

Element

Association

Description

SelfLifeLinks are all and only BinaryLinks where the sourceParticipant and targetParticipant are either

- Occurrences (which might be lives) that are portions of the same life, or
- Data values that are equal.

General Types

BinaryLink

Features

myselfSameLife : Anything [1..*] {redefines toSources}

The target end of a SelfLifeLink.

selfSameLife : Anything [1..*] {redefines toTargets}

The source end of a SelfLifeLink.

sourceDataValue : DataValue [0..1] {subsets source}

Same as the sourceParticipant when it is a data value.

sourceOccurrence : Occurrence [0..1] {subsets source}

Same as the sourceParticipant when it is an occurrence.

targetDataValue : DataValue [0..1] {subsets target}

Same as the targetParticipant when it is a data value.

targetOccurrence : Occurrence [0..1] {subsets target}

Same as the targetParticipant when it is an occurrence.

Constraints

None.

9.2.2.2.6 things

Element

Feature

Description

`things` is the most general Feature (M1 instance of M2 Feature). All other Features (in libraries or user models) specialize it (subset or redefine, directly or indirectly). It is typed by Anything.

`things` has multiplicity lower bound 1 because, for any featuring instance, it includes at least that instance as the value of `Anything::self`.

General Types

Anything

Features

that : Anything

For each value of `things`, the "featuring instance" of that value. Formally, for any sequence *s* classified by `things`, the `that` includes a sequence whose prefix is *s*, followed by the second-to-last element of *s*. This is enforced by declaring `Anything::self` to be the chaining of `things.that`, restricting `that` to the single value of `self` for all `things`.

Constraints

None.

9.2.3 Links

9.2.3.1 Links Overview

This library model introduces the most general Association *Link*, the type of *`links`*, the most general Feature typed by Associations (see 8.3.4.4 and 8.4.4.5). The *`participant`* Feature of *Link* is the most general `associationEnd`, identifying the things being linked by (at the "ends" of) each *Link* (exactly one thing per end, which might be the same things). *Link* is specialized into *BinaryLink*, the most general Association with exactly two `associationEnds`, *source* and *target*, which subset *`participant`* and identify the two things linked, which might be the same thing. *BinaryLink* is the `type` of *`binaryLinks`*, the most general Feature typed by binary Associations. They are specialized into *SelfLink* and *`selfLinks`*, respectively, for links that have the same thing on both ends, identified by *`thisThing`* and *`thatThing`*, redefining *`source`* and *`target`*, respectively. These are used by BindingConnectors to specify that Features have the same values (see 8.3.4.5). *SelfLinks* are not in time or space (they are not Occurrences, see 9.2.4).

9.2.3.2 Elements

9.2.3.2.1 BinaryLink

Element

Association

Description

BinaryLink is a Link with exactly two participant Features ("binary" Association). All other binary associations (in libraries or user models) specialize it (directly or indirectly).

General Types

Link

Features

participant : Anything {redefines participant, ordered, nonunique}

The participants of this BinaryLink, which are restricted to be exactly two.

source : Anything {subsets participant}

The participant that is the source of this BinaryLink.

target : Anything {subsets participant}

The participant that is the target of this BinaryLink.

toSources : Anything [0..*]

The end Feature of this BinaryLink corresponding to the `sourceParticipant`.

toTargets : Anything [0..*]

The end Feature of this BinaryLink corresponding to the `targetParticipant`.

Constraints

None.

9.2.3.2.2 binaryLinks

Element

Feature

Description

`binaryLinks` is a specialization of `links` restricted to type BinaryLink. All other Features typed by BinaryLink or its specializations (in libraries or user models) specialize it (directly or indirectly).

General Types

links
BinaryLink

Features

[no name] : Anything

[no name] : Anything

Constraints

None.

9.2.3.2.3 Link

Element

Association

Description

Link is the most general Association (M1 instance of M2 Association). All other Associations (in libraries or user models) specialize it (directly or indirectly). Specializations of Link are domains of Features subsetting Link::participants, exactly as many as associationEnds of the Association classifying it, each with multiplicity 1. Values of Link::participants on specialized Links must be a value of at least one of its subsetting Features.

General Types

Anything

Features

participant : Anything [2..*] {ordered, nonunique}

The participants that are associated by this Link.

Constraints

None.

9.2.3.2.4 links

Element

Feature

Description

`links` is a specialization of `things` restricted to type Link. It is the most general feature typed by Link. All other Features typed by Link or its specializations (in libraries or user models) specialize it (directly or indirectly).

General Types

things

Features

None.

Constraints

None.

9.2.3.2.5 SelfLink

Element

Association

Description

SelfLink is a BinaryLink where the sourceParticipant and targetParticipant are the same. All other BinaryLinks where this is the case specialize it (directly or indirectly).

General Types

BinaryLink
SelfSameLifeLink

Features

myself : Anything {subsets myselfSameLife}

The target end of a SelfLink.

sameThing : Anything {subsets thisThing, redefines source}

The source participant of this SelfLink, which must be the same as the target participant.

thisThing : Anything {subsets sameThing, redefines target}

The target participant of this SelfLink, which must be the same as the source participant.

Constraints

None.

9.2.3.2.6 selfLinks

Element

Feature

Description

`selfLinks` is a specialization of `binaryLinks` restricted to type SelfLink. It is the most general BindingConnector. All other BindingConnectors (in libraries or user models) specialize it (directly or indirectly).

General Types

SelfLink
binaryLinks

Features

[no name] : Anything

[no name] : Anything

Constraints

None.

9.2.4 Occurrences

9.2.4.1 Occurrences Overview

Occurrences

This library adds a model of things existing in time and space, starting with `Occurrence`, the most general Class (see 8.3.4.2), which classifies *Anything* that takes up time and space, and `occurrences`, the most general Feature typed by Classes. *Occurrences* can take up the same or overlapping time and space when they represent different things happening or existing in it. For example, the time and space taken by a room might have air moving in it it, as well as light, radio waves, and so on.

Occurrences divide into *Objects* and *Performances* (see 9.2.5.1 and 9.2.6.1, respectively), corresponding to Classes dividing into Structures and Behaviors (see 8.3.4.3 and 8.3.4.6, respectively). This subclause covers what is in common between *Objects* and *Performances*.

Temporal and Spatial Associations

Occurrences can be completely separated in time or space, or both, as indicated by these specialized *Links*:

- *HappensBefore Links* between *Occurrences* indicate they are completely separate in time, with one happening or existing completely before another. The `predecessors` and `successors` of *Occurrences* are those that *HappenBefore* them and after them (those that they *HappenBefore*), respectively. *HappensJustBefore Links* are *HappensBefore Links* between *Occurrences* where there is no possibility of other *Occurrences* happening or existing in the time between them. The `immediatePredecessors` and `immediateSuccessors` of *Occurrences* are those that *HappenJustBefore* them and just after them (those that they *HappenJustBefore*), respectively. *Occurrences* separated in time are not necessarily separated in space.

- *OutsideOf Links* between *Occurrences* indicate they are completely separate in space, without specifying their relative positions (such as above or to the left). *JustOutsideOf Links* are *OutsideOf Links* between *Occurrences* where there is no possibility of other *Occurrences* happening or existing in the space between at least some of their `spaceBoundaries`, see space boundaries below. *Occurrences* separated in space are not necessarily separated in time.

Without Links between *Occurrences* are provided as a convenience to indicate one *HappenBefore* another or is *OutsideOf* the other or both. This means they do not overlap at all in space-time.

Occurrences can completely overlap others in time or space, or both, as indicated by these specialized *Links*:

- *HappensDuring Links* between *Occurrences* indicate one happens or exists completely within the time taken by another, with the `timeEnclosedOccurrences` of an *Occurrence* being the ones that *HappenDuring* it. *Occurrences* overlapping in time do not necessarily overlap in space.

- *InsideOf Links* between *Occurrences* indicate one happens or exists completely within the space taken by another, with the `spaceEnclosedOccurrences` of an *Occurrence* being the ones that *InsideOf* it. *Occurrences* overlapping in space do not necessarily overlap in time.

Within Links between *Occurrences* are provided as a convenience to indicate one *HappensDuring* another and is *InsideOf* that other. This means one is completely overlapped by the other in space-time.

Occurrences cannot be linked by both *HappensBefore* and *HappensDuring*, *OutsideOf* and *InsideOf*., or *Within* and *Without*. They also cannot *HappenBefore* or be *OutsideOf* or *Without* themselves, but always *HappenDuring* and are *InsideOf* and *Within* themselves. When an *Occurrence HappensBefore* another, all *Occurrences* that *HappenDuring* the earlier one (including itself) also *HappenBefore* those that *HappenDuring* the later one (including itself).

Occurrences that *HappenDuring* each other both ways (circularly) happen or exist at the same time, which is provided for convenience by *HappensWhile*, a specialization of *HappenDuring*. *Occurrences* that are *InsideOf* each other both ways occupy exactly the same space, even though they might happen or exist at separate times. *Occurrences* that are *Within* each other both ways happen at exactly the same time and occupy exactly the same space, which is provided for convenience by *WithinBoth*, a specialization of *Within*.

The *Links* above to do not take up time or space, they are temporal and spatial relations between things that do (they are disjoint with *LinkObject*, see 9.2.5.1).

Other Time-Space Relations

The time and space taken by an *Occurrence* can be related in three ways to the time and space taken by others, identified by the Features below. An *Occurrence* with values for these Features takes the same time and space as

- `unionOf`: taken by all the other *Occurrences* together.
- `intersectionOf`: is common to all the other *Occurrences*.
- `differencesOf`: the first other *Occurrence* that is not taken by the rest.

The values of the above Features are *Sets* of *Occurrences* to enable the time and space of an *Occurrence* to be specified in multiple ways, with each set taken as a complete specification of the time and space taken by the *Occurrence*.

Portions

It is useful to consider *Occurrences* during only some of the time and space they take up, which are other *Occurrences* identified as `portions` (the most general portion Feature, see 9.2.4.2.14 and 8.3.3.3). These are the same "thing" as their larger *Occurrences*, just considered for a potentially smaller period of time and region in space. They must be classified the same way as the *Occurrences* they are `portionsOf`, or more specialized.

Occurrences are always `portionsOf` themselves. *Occurrences* that are only `portionsOf` of themselves are *Lives* (classified by the library Class *Life*). *Lives* take up the entire time and space of a thing that happens or exists. *Occurrences* have the same *Life* as those they are `portionsOf`, identified by `portionOfLife`. This means following `portionsOf` repeatedly will always reach a single *Life*, even though some *Occurrences* along the way might be `portionsOf` of more than one other *Occurrence*.

SelfSameLifeLinks include *SelfLinks* (*Links* between each thing and itself, see 9.2.3.1), as well as *Links* between *Occurrences* that are `portionsOf` the same *Life* (have the same `portionOfLife`).

Time and Space Slices

Time slices are `portions` that include all the space of their larger *Occurrences* within a potentially smaller period of time than the whole *Occurrence*, identified as `timeSlices` of the *Occurrences* they are `portionsOf`. Time slices might have Feature values and *Links* to other things peculiar to their smaller period of time. *Occurrences* are always `timeSlicesOf` themselves. The `snapShots` of *Occurrences* are `timeSlices` that take no time. The earliest `snapShot` of an *Occurrence* is its `startShot`, the latest is its `endShot`. All the others happen during its `middleTimeSlice`. *Occurrences* with a `startShot` the same as their `endShot` take no time, have no `middleTimeSlice`, and vice-versa.

Space slices are `portions` that include all the space of their larger *Occurrences*, but not necessary all their time, identified as `spaceSlices` of the *Occurrences* they are `portionsOf`. Space slices might have Feature values and Links to other things peculiar to their smaller region in space. *Occurrences* are always `spaceSlicesOf` themselves. The `spaceShots` of *Occurrences* are `spaceSlices` that have a lower `innerSpaceDimension` than the *Occurrences* they are `spaceSlicesOf`, which is the number of variables needed to identify any space point occupied by an *Occurrence*, without regard to higher dimensional spaces in which it might be embedded. For

example, the *innerSpaceDimension* of a *Curve* is 1 (see 9.2.5.1), because points on it can be identified by the distance from one end, even if the curve bends in two or three dimensions. A *Curve* can be a *spaceShot* of a *Surface* or *Body*, which have *innerSpaceDimension* of 2 and 3, respectively. The *spaceSlices* of an *Occurrence* that are not *spaceShots* must have the same *innerSpaceDimension* as the *Occurrence*. How much an *Occurrence* bends in higher dimensions is its *outerSpaceDimension* (see 9.2.5.1). For example, the *outerSpaceDimension* of a planar curve is 2 or 1 (*Line*), while it is 3 for non-planar.

Space Boundaries and Interiors

The *spaceSlices* of each *Occurrence* are divided into a *spaceBoundary*, which is a *spaceShot*, and a *spaceInterior*, which is a *spaceSlice* that is not a *spaceShot* (has the same *innerSpaceDimension* as the *Occurrence*). They are *JustOutsideOf* each other and union (see below) to the entire *Occurrence*. Space boundaries cannot have a *spaceBoundary*, which means they also cannot have a *spaceInterior*, indicated by *isClosed*=true, For example, a ball has a sphere as its *spaceBoundary*, but the sphere *isClosed*.

A *spaceBoundary* might have *spaceSlices* that are also closed and have the same *innerSpaceDimension* as the *spaceBoundary* (not among its *spaceShots*). In some cases one of these *spaceSlices* surrounds the others, identified as the *outer*, a nested feature of *spaceBoundary*, and the others as the *inner* ones. This means the *outer* one can be taken as the *spaceBoundary* of another *Occurrence* with a *spaceInterior* that completely includes the *inners*. The *inner spaceBoundaries* can also be taken as *spaceBoundaries* of their own *Occurrences*, the *spaceInteriors* of which are identified as the *innerSpaceOccurrences* ("holes") of the *Occurrence* having the *spaceBoundary*. These two cases are covered by *SurroundedBy Links* between *Occurrences*.

MatesWith Links are *JustOutsideOf Links* between *Occurrences* indicating that they union (see below) to an *Occurrence* with a *spaceBoundary* but no *spaceInterior*. This means there is no possibility of other *Occurrences* happening or existing in the space between them. *JustOutsideOf Links* additionally include those between *Occurrences* where only some of their *spaceSlices* (of their *spaceBoundaries*) are linked by *MatesWith*.

9.2.4.2 Elements

9.2.4.2.1 HappensBefore

Element

Association

Description

HappensBefore is a Withoutassociation linking an `earlierOccurrence` to a `laterOccurrence`, indicating that the Occurrences do not overlap in time (not necessarily in space, see OutsideOf; none of their `snapshots` happen at the same time), and the `earlierOccurrence` happens first. This means noOccurrence HappensBefore itself. Every Occurrence that HappensDuring the `earlierOccurrence` (including itself) also HappensBefore every Occurrence that HappensDuring the `laterOccurrence` (including itself).

General Types

HappensLink
Without

Features

earlierOccurrence : Occurrence {redefines separateOccurrenceToo}

The participant that happens earlier than (before) the other participant.

laterOccurrence : Occurrence {redefines separateOccurrence}

The participant that happens later than (after) the other participant.

Constraints

None.

9.2.4.2.2 happensBeforeLinks

Element

Feature

Description

`happensBeforeLinks` is a specialization of `binaryLinks` restricted to type `HappensBefore`. It is the most general Succession (M1 instance of M2 Succession). All other Successions (in libraries or user models) specialize it (directly or indirectly).

General Types

HappensBefore
binaryLinks

Features

[no name] : Occurrence

[no name] : Occurrence

Constraints

None.

9.2.4.2.3 HappensDuring

Element

Association

Description

HappensDuring links its `shorterOccurrence` to its `longerOccurrence`, indicating that the `shorterOccurrence` completely overlaps the `longerOccurrence` in time (not necessarily in space, see InsideOf; all `snapshots` of the `shorterOccurrence` happen at the same time as some `snapshot` of the `longerOccurrence`). This means every Occurrence HappensDuring itself and that HappensDuring is transitive. Every Occurrence that HappensBefore the `longerOccurrence` also HappensBefore the `shorterOccurrence`. The `shorterOccurrence` also HappensBefore every Occurrence that the `longerOccurrence` does.

General Types

HappensLink

Features

happensDuring : Occurrence [1..*] {subsets happensTarget}

Occurrences that completely overlap this one in time (not necessarily in space, see `insideOf`; they start when this one does or earlier and end when this one does or later), including this one.

longerOccurrence : Occurrence {redefines targetOccurrence}

The participant in this HappensDuring Link that takes up more (or equal) time than the other.

shorterOccurrence : Occurrence {redefines sourceOccurrence}

The participant in this HappensDuring Link that takes up less (or equal) time than the other.

Constraints

None.

9.2.4.2.4 HappensJustBefore

Element

Association

Description

HappensJustBefore is HappensBefore asserting that there is no possibility of other Occurrences happening in the time between the `earlierOccurrence` and `laterOccurrence`.

General Types

HappensBefore

Features

None.

Constraints

None.

9.2.4.2.5 HappensLink

Element

Association

Description

General Types

BinaryLink

Features

happensSource : Occurrence [0..*] {subsets toSources}

happensTarget : Occurrence [0..*] {subsets toTargets}

sourceOccurrence : Occurrence {redefines source}

targetOccurrence : Occurrence {redefines target}

Constraints

None.

9.2.4.2.6 HappensWhile

Element

Association

Description

HappensWhile is a HappensDuring and its inverse. This means the linked Occurrences completely overlap each other in time (they happen at the same time) all `snapshots` of each Occurrence happen at the same time as one of the `snapshots` of other. This means every Occurrence HappensWhile itself and that HappensWhile is transitive.

General Types

HappensDuring

Features

happensWhile : Occurrence [1..*] {subsets happensDuring}

Occurrences that start and end at the same time as this one.

happensWhile[1] : Occurrence [1..*] {subsets timeEnclosedOccurrences}

Occurrences that `happenWhile` this one does (Occurrences that start and end at the same time as this one).

thatOccurrence : Occurrence {redefines longerOccurrence}

thisOccurrence : Occurrence {redefines shorterOccurrence}

Constraints

None.

9.2.4.2.7 IncomingTransferSort

Element

Predicate

Description

A predicate of two transfers that is true when the first should be accepted instead of the other.

General Types

BooleanEvaluation

Features

None.

Constraints

None.

9.2.4.2.8 InnerSpaceOf

Element

Description

General Types

None.

Features

innerSpace : Occurrence

innerSpaceOccurrenceOf : Occurrence {subsets separateSpaceToo}

outerSpace : Occurrence

Constraints

None.

9.2.4.2.9 InsideOf

Element

Association

Description

InsideOf is a BinaryLink between its `smallerSpace` and `largerSpace`, indicating that the `largerSpace` completely overlaps the `smallerSpace` in space (not necessarily in time, see HappensDuring; all four dimensional points of the `smallerSpace` are in the spatial extent of the `largerSpace`). This means every Occurrence/ is InsideOf itself and that InsideOf is transitive.

General Types

BinaryLink

Features

insideOf : Occurrence [1..*] {subsets toTargets}

Occurrences that completely overlap this one in space (not necessarily in time, see `happensDuring`), including this one.

largerSpace : Occurrence {redefines target}

The participant in this InsideOf Link that takes up more (or equal) space than the other.

smallerSpace : Occurrence {redefines source}

The participant in this InsideOf Link that takes up less (or equal) space than the other.

Constraints

None.

9.2.4.2.10 JustOutsideOf

Element

Description

General Types

None.

Features

justOutsideOf : Occurrence [0..*] {subsets outsideOf}

justOutsideOfToo : Occurrence [0..*] {subsets outsideOfToo}

Constraints

None.

9.2.4.2.11 Life

Element

Class

Description

Life is the class of Occurrences that are "maximal portions". That is, they are only portions of themselves.

General Types

Occurrence

Features

portion : Occurrence [1..*]

Occurrences that are portions of this Life, including at least this Life.

Constraints

None.

9.2.4.2.12 MatesWith

Element

Description

General Types

None.

Features

matesWith : Occurrence [0..*] {subsets justOutsideOf}

Constraints

None.

9.2.4.2.13 messageConnections

Element

Feature

Description

`messageConnections` is the base feature of all FlowConnectionUsages.

General Types

MessageConnection
transfers
binaryConnections
actions

Features

[no name] : Occurrence

[no name] : Occurrence

Constraints

None.

9.2.4.2.14 Occurrence

Element

Class

Description

An Occurrence is Anything that happens over time and space (the four physical dimensions). Occurrences can be portions of another Occurrence within time and space, including slices in time, leading to snapshots that take zero time.

General Types

Anything

Features

difference : Occurrence [0..1]

A (nested) feature of `differencesOf` identifying an Occurrence that is the `intersectionsOf` of the Occurrences identified by `interdiff` (`minuend` and `interdiff.notSubtrahend`).

differencesOf : OrderedSet [0..*]

Ordered sets of Occurrences, where the time and space taken by first Occurrence in each set (`minuend`) that is not in the time and space taken by the remaining Occurrences (`subtrahend`, resulting in `difference`) is the same as taken by this Occurrence (all four dimensional points in the `minuend` that are not in any `subtrahend` are at the same time and space as those in this Occurrence).

dispatchScope : Occurrence

elements : Occurrence [0..*]

A nested feature of `unionsOf`, `intersectionsOf`, and `differencesOf` for the elements of each of their (Ordered)Sets separately.

endShot : Occurrence {subsets snapshots}

The `snapshot` of this Occurrence that `happensAfter` all its other `snapshots`.

immediatePredecessors : Occurrence [0..*] {subsets predecessors}

Occurrences that *HappensJustBefore* this one (*Occurrences* that *HappensBefore* this one, with no possibility of other *Occurrences* happening in the time between them).

immediateSuccessors : Occurrence [0..*] {subsets successors}

Occurrences that this one *HappensJustBefore* (*Occurrences* that this one *HappensBefore*, with no possibility of other *Occurrences* happening in the time between them).

incomingTransfer : Transfer [0..*]

incomingTransferSort : IncomingTransferSort [0..*]

Determines which transfers to accept when multiple are available and which of the unaccepted transfers are never to be accepted (dispatched), by comparing two transfers at a time. Defaults to `earlierFirstIncomingTransferSort`, which is true if the first transfer ends (arrives) before the other.

incomingTransferToSelf : Transfer [0..*] {subsets incomingTransfer}

Transfers for which this Occurrence is the `targetParticipant`.

inner : Occurrence [0..*]

A `spaceSlice` of `spaceBoundary`, see `spaceBoundary`.

innerSpaceDimension : Natural

The number of variables needed to identify space points in this Occurrence, from 0 to 3, without regard to higher dimensional spaces it might be emedded in. For example, the `innerSpaceDimension` of a curve is 1, even if it twists in three dimensions, see `outerSpaceDimension`.

innerSpaceOccurrences : Occurrence {subsets separateSpace}

Occurrences that completely occupy the space SurroundBy an `inner spaceBoundary` of this Occurrence.

interdiff : Set [0..*]

A (nested) feature of `differencesOf` identifying a set that includes its `minuend` and all Occurrences that are not in its `subtrahend`.

intersection : Occurrence [0..1]

A (nested) feature of `intersectionsOf` identifying an Occurrence that a) is completely `within` (the space and time of) all `intersectionsOf elements`, and b) satisfies the conditions of the same `element`'s `nonIntersection`.

intersectionsOf : Set [0..*]

Sets of Occurrences, where the time and space taken in common between the Occurrences in each set (`intersectionsOf::intersection`) is at the same as taken by this Occurrence (all four dimensional points common to the Occurrences in each set are at the same time and space as those in this Occurrence).

/isClosed : Boolean

True if this Occurrence has a `spaceBoundary`, false otherwise.

isDispatch : Boolean

Determines whether the same incoming transfer can be accepted more than once by StatePerformances composed under `dispatchScope`. It defaults to `true` for Performances, and `false` for other Occurrences (including Objects)
.

isRunToCompletion : Boolean

Determines whether TransitionPerformances composed under `runToCompletionScope` can happen during StatePerformance `entry` Performances composed under this Occurrence.

localClock : Clock

A local *`Clock`* to be used as the corresponding time reference for this *`Occurrence`* and, by default, all *`ownedOccurrences`*. By default this is the singleton *`Clocks::universalClock`*.

matingOccurrences : Occurrence [0..*] {subsets justOutsideOfToo}

Occurrences that have no space between them and this one.

middleTimeSlice : Occurrence [0..1] {subsets timeSlices}

`timeSlice` of this Occurrence that takes all of the time between its `startShot` and code>endShot. Occurrences do not have `middleTimeSlice` if their `startShot` is the same as their `endShot` (such as being a `snapShot` of another Occurrence), otherwise they do.

minuend : Occurrence [0..1] {subsets }

A (nested) feature of `differencesOf` that identifies the first Occurrence in its `elements`.

nonIntersection : Occurrence [0..*] {subsets spaceTimeEnclosedPoints}

A nested feature of `intersectionsOf.elements` identifying all the `spaceTimeEnclosedPoints` of each `element` that are not identified by `intersection`. These must be `without` (separate in space or time from) at least one other `element`.

notSubtrahend : Occurrence [0..*]

A (nested) feature of `differencesOf.interdiff` identifying all Occurrences that are not identified by the `subtrahend` in each value `differencesOf` separately.

outer : Occurrence [0..1]

A `spaceSlice` of `spaceBoundary`, see `spaceBoundary`.

outerSpaceDimension : Natural [0..1]

For Occurrences of `innerSpaceDimension` 1 or 2, the number of variables needed to identify their space points in higher dimensional spaces they might be embedded in, from the `innerSpaceDimension` to 3. For example , an `outerSpaceDimension` 3 for a curve indicates it twists in three dimensions. An `outerSpaceDimension` equal to `innerSpaceDimension` indicates the occurrence is spatially straight (`innerSpaceDimension` 1 embedded in 2 or 3 dimensions) or flat (`innerSpaceDimension` 2 embedded in 3 dimensions).

outgoingTransfer : Transfer [0..*]

outgoingTransferFromSelf : Transfer [0..*] {subsets outgoingTransfer}

Transfers for which this Occurrence is the `sourceParticipant`.

portion : Occurrence [1..*] {subsets spaceTimeEnclosedOccurrences}

All occurrences `within` this one that are considered the same thing occurring (same `portionOfLife`), including this one.

portionOf : Occurrence [1..*] {subsets within}

All occurrences that this one is `within`that are considered the same thing occurring (same `portionOfLife`), including this one.

portionOfLife : Life

The Life of which this Occurrence is a `portion`.

predecessors : Occurrence [0..*] {subsets withoutToo}

Occurrences that are completely separate from this one in time (not necessarily in space, see `outsideOfToo`) and that happen before this one (end earlier than this one starts).

runToCompletionScope : Occurrence

self : Occurrence {subsets timeSlices, spaceSlices, redefines self}

This Occurrence (related to itself via a SelfLink).

snapshotOf : Occurrence [0..*] {subsets timeSliceOf}

Occurrences of which this Occurrence is a `snapshot`.

snapshots : Occurrence [1..*] {subsets timeSlices}

All `timeSlices` of this Occurrence that happen at a single instant of time (zero duration).

spaceBoundary : Occurrence [0..1] {subsets spaceShots}

A `spaceShot` of this Occurrence that is not among those of its `spaceInterior`, which it must be OutsideOf. It must not have a `spaceBoundary` (`isClosed` = true). It can be divided into `spaceSlices` that also have no `spaceBoundary`, where the `inner` ones are `SurroundedBy` the `outer` one.

spaceEnclosedOccurrences : Occurrence [1..*] {subsets toSources}

Occurrences that this one completely overlaps in space (not necessarily in time, see `timeEnclosedOccurrences`), including this one.

spaceInterior : Occurrence [0..1] {subsets spaceSlices}

A `spaceSlice` of this Occurrence that includes all its `spaceShots` except the `spaceBoundary`, which must exist and be `outsideOf` it. The `spaceInterior` must be of the same `innerSpaceDimension` as this Occurrence, except if it is zero, whereupon there is no `spaceInterior`.

spaceShots : Occurrence [1..*] {subsets spaceSlices}

All `spaceSlices` of this Occurrence that are of a lower `innerSpaceDimension` than it.

spaceSliceOf : Occurrence [1..*] {subsets portionOf}

An Occurrence this one is a `spaceSlices` of.

spaceSlices : Occurrence [1..*] {subsets portion}

All `portions` of this Occurrence that extend for exactly the same time and some or all the space, relative to spatial location of this Occurrence. This means every Occurrence is a `spaceSlice` of itself.

spaceTimeCoincidentOccurrences : Occurrence [1..*] {subsets spaceTimeEnclosedOccurrences}

Occurrences that this one completely includes in both space and time, including this one.

spaceTimeEnclosedOccurrences : Occurrence [1..*] {subsets spaceEnclosedOccurrences, timeEnclosedOccurrences}

All `timeEnclosedOccurrences` of this one that are `insideOf` it, including itself.

spaceTimeEnclosedPoints : Occurrence [1..*] {subsets spaceTimeEnclosedOccurrences}

All `spaceTimeEnclosedOccurrences` of this one that take up no time or space (`innerSpaceDimension` 0 and `startShot` the same as `endShot`).

startShot : Occurrence {subsets snapshots}

The `snapshot` of this Occurrence that `happensBefore` all its other `snapshots`.

suboccurrences : Occurrence [0..*]

Composite *`suboccurrences`* of this *`Occurrence`*. The *`localClock`* of all *`suboccurrences`* defaults to the *`localClock`* of its containing *`Occurrence`*.

subtrahend : Occurrence [0..*] {subsets }

A (nested) feature of `differencesOf` that identifies all the Occurrences in its `elements` except the first one.

successors : Occurrence [0..*] {subsets without}

Occurrences that are completely separate from this one in time (not necessarily in space, see `outsideOf`) and that happen after this one (start later than this one ends).

this : Occurrence

The "context" Occurrence within which this Occurrence takes place. By default, it is this Occurrence itself. However, this is overridden for `ownedPerformances` of Objects and `subperformances` of Performances.

timeEnclosedOccurrences : Occurrence [1..*] {subsets happensSource}

Occurrences that this one completely overlaps in time (not necessarily in space, see `inside`; they start at the same time or later and end at the same time or earlier), including this one.

timeSliceOf : Occurrence [1..*] {subsets portionOf}

Occurrences of which this one is a `timeSlice`, including this one.p

timeSlices : Occurrence [1..*] {subsets portion}

`portions`that extend for some or all the time of this Occurrence, but all its space during that time, including itself.

union : Occurrence [0..1]

A (nested) feature of `unionsOf` identifying an Occurrence with a) `spaceTimeEnclosedOccurrences` including all those identified by a `unionsOf` `element`, and b) all the Occurrence's `spaceTimeEnclosedPoints` `within` (the space and time of) at least one of the `elements`.

unionsOf : Set [0..*]

Sets of Occurrences, where the time and space taken by all the Occurrences in each set together (`unionsOf::union`) is the same as taken by this Occurrence (all four dimensional points in the Occurrences of each set are at the same time and space as those of this Occurrence).

Constraints

None.

9.2.4.2.15 occurrences

Element

Feature

Description

`occurrences` is a specialization of `things` restricted to type Occurrence. It is the most general feature typed by Occurrence. All other Features typed by Occurrence or its specializations (in libraries or user models) specialize it (directly or indirectly).

General Types

things
Occurrence

Features

None.

Constraints

None.

9.2.4.2.16 OutsideOf

Element

Association

Description

OutsideOf is a Without association linking its `separateSpaceToo` and its `separateOccurrence`, indicating that these Occurrences do not overlap in space (not necessarily in time, see HappensBefore; no four dimensional points of the Occurrences are in the spatial extent of both of them). This means no Occurrence is OutsideOf itself.

General Types

Without

Features

outsideOf : Occurrence [0..*] {subsets without}

Occurrences that are completely separate from this one in space (not necessarily in time, see `successors`).

outsideOfToo : Occurrence [0..*] {subsets withoutToo}

Occurrences that are completely separate from this one in space (not necessarily in time, see `predecessors`).

separateSpace : Occurrence {redefines separateOccurrence}

The second participant in this OutsideOf Link.

separateSpaceToo : Occurrence {redefines separateOccurrenceToo}

The first participant in this OutsideOf Link.

Constraints

None.

9.2.4.2.17 PortionOf

Element

Association

Description

PortionOfis a Within that links its `portionOccurrence` to its `portionedOccurrence`, indicating they are considered the same thing occurring (same `portionOfLife`), but with the `portionOccurrence` potentially taking up less time and space than the `portionedOccurrence`. This means every Occurrence/ is a PortionOf itself. The `innerSpaceDimension` of `portionOccurrence` is the same or lower than of the `portionedOccurrence`.

General Types

Within

Features

portionedOccurrence : Occurrence {redefines largerOccurrence}

The participant in this PortionOf Link that is the `largerOccurrence`.

portionOccurrence : Occurrence {redefines smallerOccurrence}

The participant in this PortionOf Link that is the `smallerOccurrence`.

Constraints

None.

9.2.4.2.18 SnapshotOf

Element

Association

Description

SnapshotOfis a TimeSliceof that links its `snapshotOccurrence` to its `snapshottedOccurrence`, indicating that `snapshotOccurrence` takes not time (startShot and endShot are the same).

General Types

TimeSliceOf

Features

snapshotOcccurrence : Occurrence {redefines timeSliceOccurrence}

The participant in this SnapshotOf Link that is the `timeSliceOccurrence`.

snapshottedOccurrence : Occurrence {redefines timeSlicedOccurrence}

The participant in this SnapshotOf Link that is the `timeSlicedOccurrence`.

Constraints

None.

9.2.4.2.19 SpaceShotOf

Element

Association

Description

SpaceShotOf is a SpaceSliceOf that links its `spaceShotOccurrence` to its `spaceSnapshottedOccurrence`, indicating the `spaceShotOccurrence` is of a lower `innerSpaceDimension` than the `spaceShottedOccurrence`.

General Types

SpaceSliceOf

Features

spaceShotOccurrence : Occurrence {redefines spaceSliceOccurrence}

The participant in this SpaceShotOf Link that is the `spaceSliceOccurrence`.

spaceShotOf : Occurrence [1..*] {subsets spaceSliceOf}

All `spaceSlicesOf` this Occurrence that are of a higher `innerSpaceDimension` than this Occurrence.

spaceShottedOccurrence : Occurrence {redefines spaceSlicedOccurrence}

The participant in this SpaceShotOf Link that is the `spaceSliced Occurrence`.

Constraints

None.

9.2.4.2.20 SpaceSliceOf

Element

Association

Description

SpaceSliceOfis a PortionOf that links its `spaceSliceOccurrence` to its `spaceSlicedOccurrence`, indicating the `spaceSliceOccurrence` extends for exactly the same time and some or all the space of the `spaceSlicedOccurrence` and that the `spaceSliceOccurrence` is of the same of lower `innerSpaceDimension` than the `spaceSliceOccurrence`. This means every Occurrence/ is a SpaceSliceOf itself and SpaceSliceOf is transitive.

General Types

PortionOf

Features

spaceSlicedOccurrence : Occurrence {redefines portionedOccurrence}

The participant in this SpaceSliceOf Link that is the `portionedOccurrence`.

spaceSliceOccurrence : Occurrence {redefines portionOccurrence}

The participant in this SpaceSliceOf Link that is the `portionOccurrence`.

Constraints

None.

9.2.4.2.21 SurroundedBy

Element

Description

General Types

None.

Features

surroundedBy : Occurrence [0..*] {subsets outsideOfToo}

surroundedSpace : Occurrence

surroundingSpace : Occurrence

surrounds : Occurrence [0..*] {subsets outsideOf}

Constraints

None.

9.2.4.2.22 TimeSliceOf

Element

Association

Description

TimeSliceOfis a PortionOf that links its `timeSliceOccurrence` to its `timeSlicedOccurrence`, indicating that extend for exactly the same time and some or all the space of this Occurrence, including itself. This means every Occurrence/ is a PortionOf itself.

General Types

PortionOf

Features

timeSlicedOccurrence : Occurrence {redefines portionedOccurrence}

The participant in this TimeSliceOf Link that is the `portionedOccurrence`.

timeSliceOccurrence : Occurrence {redefines portionOccurrence}

The participant in this TimeSliceOf Link that is the `portionOccurrence`.

Constraints

None.

9.2.4.2.23 Within

Element

Association

Description

Within classifies all and only links that are HappensDuring and InsideOf. They link their `largerOccurrence` to their `smallerOccurrence`, indicating the `largerOccurrence` completely overlaps the `smallerOccurrence` in time and space (all four dimensional points of the `smallerOccurrence` HappensDuring and are InsideOf the `largerOccurrence`). This means every Occurrence is Within itself and Within is transitive.

General Types

HappensDuring
InsideOf

Features

largerOccurrence : Occurrence {redefines largerSpace, longerOccurrence}

The participant in this Within Link that is the `longerOccurrence` and `largerSpace`.

smallerOccurrence : Occurrence {redefines shorterOccurrence, smallerSpace}

The participant in this Within Link that is the `shorterOccurrence` and `smallerSpace`.

within : Occurrence [1..*] {subsets insideOf, happensDuring}

All Occurrences that this one `happensDuring` and is `insideOf`, including this one.

Constraints

None.

9.2.4.2.24 WithinBoth

Element

Association

Description

WithinEachOther is a Within and its inverse. This means the linked Occurrences completely overlap each other in space and time (they occupy the same four dimensional region). This means every Occurrence is WithinEachOther with itself and WithinEachOther is transitive.

General Types

Within

Features

thatOccurrence : Occurrence {redefines largerOccurrence}

thisOccurrence : Occurrence {redefines smallerOccurrence}

withinBoth : Occurrence [1..*] {subsets within}

Constraints

None.

9.2.4.2.25 Without

Element

Association

Description

Without classifies all links that are HappensDuring or InsideOf, or both. They link their `separateOccurrenceToo` to their `separateOccurrence`, indicating that the Occurrences do not overlap in time or space (no four dimensional point is in both Occurrences). This means no Occurrence is Without itself.

General Types

BinaryLink

Features

separateOccurrence : Occurrence {redefines target}

The second participant in this Without Link.

separateOccurrenceToo : Occurrence {redefines source}

The first participant in this Without Link.

without : Occurrence [0..*] {subsets toTargets}

All Occurrences that are `successors` of this one and are `outsideOf` it.

withoutToo : Occurrence [0..*] {subsets toSources}

All Occurrences that are `predecessors`of this one and are `outsideOfToo` it.

Constraints

None.

9.2.5 Objects

9.2.5.1 Objects Overview

Objects are *Occurrences* that take up a single region of time and space, even though they might be in multiple places over time. *Object* is the most general Structure, while *`objects`* is the most general Feature typed by Structures (see 8.3.4.3 and compare to *Performances* in 9.2.6.1). *Objects* and *Performances* do not overlap, but *Performances* can Involve *Objects*, which can *Perform Performances*.

LinkObjects are *Objects* that are also *Links*, and *`linkObjects`* is the most general Feature typed by *LinkObject*. *LinkObjects* occupy time and space, like other *Objects*, with potentially varying relationships to other things over time, except for which things are its *`participants`* (the things being linked), identified by its `associationEnd` Features (the "ends" of a link are permanent, though *`participants`* can be *Occurrences* with changing relationships to other things). The values of *LinkObject* Features that are not `associationEnds` can change over time. *LinkObjects* can exist between the same *Occurrences* for only some of the time those *Occurrences* exist, reflecting changing relationships of those *Occurrences*. *BinaryLinkObjects* are *BinaryLinks* that are also *LinkObjects*, and *`binaryLinkObjects`* is the most general Feature typed by *BinaryLinkObject*.

Body(s), *Surfaces*, *Curves*, and *Points* are *Objects* with *`innerSpaceDimension`* of 3, 2, 1, and 0, respectively.

Structured Space Objects

StructuredSpaceObjects are *Objects* with three Features Subsetting *`spaceSlices`*:

- *`faces`*, identifying *Surfaces*.
- *`edges`*, identifying *Curves*.
- *`vertices`*, identifying *Points*.

The above are collectively *`structuredSpaceCells`*, which are also *StructuredSpaceObjects*, enabling *faces* to identify *`edges`* and *`vertices`* among the *`spaceSlices`* of their *`spaceBoundaries`*, if any, and *`edges`* to identify *`vertices`* among theirs. Cells of closed *StructuredSpaceObjects* (*`isClosed`*=true) must be *JustOutside* others along their entire *`spaceBoundary`* (every cell's *`spaceSlices`* must *MateWith* some *`spaceSlice`* of another cell, see Space Boundaries and Interiors in 9.2.4.1), which usually means all the *`edges`* and *`vertices`* of cells *MateWith* those of other cells, enabling the *StructuredSpaceObject* to be the *`spaceBoundary`* for other *Objects*. The *`innerSpaceDimension`* of a *StructuredSpaceObject* is the highest *`innerSpaceDimension`* of its *`structuredSpaceCells`*.

Models can specialize the three Features above for various kinds of *Objects*, for example, one for cylinders would include:

- Three Features Subsetting `faces` for the top, bottom, and middle *Surfaces* of a cylinder. The `edges` of these Features are *Curves* (circles) that are `spaceBoundaries` of the top and bottom *Surfaces* (discs), and `spaceSlices` of the `spaceBoundary` of the middle *Surface* (a rectangle joined at two opposite sides).
- Two Features Subsetting `edges` for the top and bottom of the cylinder. Each Feature identifies two *Curves* that are the *edges* of adjacent *faces*, specified by *BindingConnectors* between the Feature and required `edges`. These two *Curves* must mate, specified by a `MateWith` Connector between the Feature and itself.
- A Feature redefining `vertices` to multiplicity 0.

9.2.5.2.7 Object

Element

Structure

Description

An *`Object`* is an *`Occurrence`* that is not a *`Performance`*. It is the most general *`Structure`*. All other *`Structures`* specialize it directly or indirectly.

General Types

Occurrence

Features

enactedPerformances : Performance [0..*] {subsets timeEnclosedOccurrences, involvingPerformances}

Performances that are enacted by this object.

involvingPerformances : Performance [0..*]

Performances in which this Object is involved.

ownedPerformances : Performance [0..*] {subsets timeEnclosedOccurrences, involvingPerformances, suboccurrences}

`Performances` that are owned by this *`Object`*. The owning *`Object`* is the default *`this`* reference for all *`ownedPerformances`*.

structuredSpaceBoundary : StructuredSpaceObject [0..1] {subsets spaceBoundary}

A `spaceBoundary` that is a StructuredSpaceObject.

subobjects : Object [0..*] {subsets suboccurrences}

The *`suboccurrences`* of this *`Object`* that are also *`Objects`*.

Constraints

None.

9.2.5.2.8 objects

Element

Feature

Description

`objects` is a specialization of `occurrences` restricted to type Object. It is the most general feature typed by Object. All other Features typed by Object or its specializations (in libraries or user models) specialize it (directly or indirectly).

9.2.5.2.9 Point

Element

Structure

Description

Objects of `innerSpaceDimension` 0.

General Types

Object

Features

innerSpaceDimension : Integer {redefines innerSpaceDimension}

Constraints

None.

9.2.5.2.10 StructuredSpaceObject

Element

Structure

Description

Objects that are broken up into smaller `structuredSpaceCells` of the same or lower `innerSpaceDimension`: `faces` of `innerSpaceDimension` 2, `edges` of `innerSpaceDimension` 1, and `vertices` of `innerSpaceDimension` 0, with the highest of these being the `innerSpaceDimension` of the StructuredSpaceObject. Boundaries of `structuredSpaceObjectCells` are the union of others of lower `innerSpaceDimension` (edges and vertices on the boundary of faces, and vertices on the boundary of edges), some of which meet when this StructuredSpaceObject `isClosed` (`faces` meet at their `edges` and/or `vertices`, while `edges` meet at their `vertices`), as required to be a `spaceBoundary` of an Object .

General Types

Object

Features

cellOrientation : Integer [0..1]

A nested feature of `structuredSpaceObjectCell` that gives them a "direction" (1 or -1) or none (0). For example, the `cellOrientation` of a `face` indicates to which side the "positive" normal vector points, of an `edge` the positive direction along the edge, and of a `vertex` the positive direction "in or out" of it. When the `cellOrientation` of all `edges` and `vertices` are given, and the StructuredSpaceObject `isClosed`, the `cellOrientations` of the (completely) overlapping ones sum to zero.

edges : Curve [0..*] {subsets structuredSpaceObjectCells, ordered}

The `structuredSpaceObjectCells` of `innerSpaceDimension` 1 in this StructuredSpaceObject.

faces : Surface [0..*] {subsets structuredSpaceObjectCells, ordered}

The `structuredSpaceObjectCells` of `innerSpaceDimension` 2 in this StructuredSpaceObject.

/innerSpaceDimension : Integer {redefines innerSpaceDimension}

Highest `innerSpaceDimension` of the `structuredSpaceObjectCells`.

structuredSpaceObjectCells : StructuredSpaceObject [1..*] {subsets spaceSlices}

All and only the `spaceSlices` of this StructuredSpaceObject that are its `faces`, `edges`, and `vertices`.

vertices : Point [0..*] {subsets structuredSpaceObjectCells, ordered}

The `structuredSpaceObjectCells` of `innerSpaceDimension` 0 in this StructuredSpaceObject.

Constraints

None.

9.2.5.2.11 Surface

Element

Structure

Description

Objects of `innerSpaceDimension` 2.

General Types

Object

Features

genus : Integer [0..1]

The number of "holes" in this Surface, assuming it `isClosed`. For example, it is 0 for spheres and 1 for toruses, including one-handled coffee cups.

innerSpaceDimension : Integer {redefines innerSpaceDimension}

Constraints

None.

9.2.6 Performances

9.2.6.1 Performances Overview

Performances

Performances are *Occurrences* that can be spread out in disconnected portions of space and time. *Performance* is the most general Behavior, while `performances` is the most general Feature typed by Behaviors (see 8.3.4.6 and compare to *Objects* in 9.2.5). *Performances* can coordinate others that *HappenDuring* them, identified as their `subperformances` (see Steps in 8.3.4.6 and 8.4.4.7). *Performances* also coordinate and potentially affect other things, some of which might come into existence (start, be "created") or cease to exist (end, be "destroyed") during a Performance, and some that might be used without being affected at all ("catalysts"). Some of these other things might be *Objects*, identified as a *Performance*'s `involvedObjects`, some of which might be "responsible" for (enact, *Perform*) a *Performance*, identified as its `performers`. *Performances* can also accept things as input or provide them as output (as `parameters`, see 8.3.4.6).

Evaluations

Evaluations are *Performances* that produce at most one thing (value) identified by their `result` parameter. *Evaluation* is the most general Function, while `evaluations` is the most general Feature identifying them, typed by Functions (see 8.3.4.7). In other respects *Evaluations* are like any other *Performance*.

LiteralEvaluations are *Evaluations* with exactly one `result`, specified as a constant in a model via classification by LiteralExpression (see 8.3.4.8 for this and the rest of the paragraph). *LiteralEvaluation* is the most general LiteralExpression, specialized in the same way, and `literalEvaluations` is the most general feature identifying them, also similarly specialized.

BooleanEvaluations are *Evaluations* (but not *LiteralEvaluations*) with exactly one `true` or `false result`. *BooleanEvaluation* is the most general Predicate, and `booleanEvaluations` is the most general feature identifying them, specialized (incompletely) into those that always have `true` or always `false results`, `trueEvaluations` and `falseEvaluations`, respectively. *LiteralBooleanEvaluation*s are *LiteralEvaluations* and *BooleanEvaluations*, with `result` specified in a model, potentially identified by `trueEvaluations` or `falseEvaluations`, or one of their specializations.

NullEvaluations are *Evaluations* that produce no values for their `result`. *NullEvaluation* is the most general NullExpression, and `nullEvalutions` is the most general Feature typed by NullExpression (see 8.3.4.8).

9.2.6.2 Elements

9.2.6.2.1 BooleanEvaluation

Element

Predicate

Description

BooleanEvaluation is a specialization of Evaluation that is the most general predicate that may be evaluated to produce a Boolean truth value.

General Types

Evaluation

Features

result : Boolean {redefines result}

The Boolean result of this BooleanExpression.

Constraints

None.

9.2.6.2.2 booleanEvaluations

Element

BooleanExpression

Description

`booleanEvaluations` is a specialization of `evaluations` restricted to type BooleanEvaluation.

General Types

BooleanEvaluation
evaluations

Features

None.

Constraints

None.

9.2.6.2.3 Evaluation

Element

Function

Description

An Evaluation is a Performance that ends with the production of a result.

General Types

Performance

Features

result : Anything [0..*] {nonunique}

The `result` is the outcome of the Evaluation.

Constraints

None.

9.2.6.2.4 evaluations

Element

Expression

Description

`evaluations` is a specialization of `performances` for Evaluations of functions.

General Types

performances
Evaluation

Features

Constraints

None.

9.2.6.2.7 LiteralEvaluation

Element

Function

Description

LiteralEvaluation is a specialization of Evaluation for the case of LiteralExpressions.

General Types

Evaluation

Features

result : DataValue {redefines result}

The result of this LiteralEvaluation, which is always a single DataValue.

Constraints

None.

9.2.6.2.8 literalEvaluations

Element

Expression

Description

`literalEvaluations` is a specialization of `evaluations` restricted to type LiteralEvaluation.

General Types

LiteralEvaluation
evaluations

Features

None.

Constraints

None.

9.2.6.2.9 MetadataAccessEvaluation

Element

Function

Description

NullEvaluation is a specialization of Evaluation for the case of null expressions.

General Types

Evaluation

Features

result : Metaobject [0..*] {redefines result}

The result of this NullEvaluation, which always must be empty (i.e., "null").

Constraints

None.

9.2.6.2.10 metadataAccessEvaluations

Element

Expression

Description

`evaluations` is a specialization of `performances` for Evaluations of functions.

9.2.6.2.13 Performance

Element

Behavior

Description

A *`Performance`* is an *`Occurrence`* that is not a *`Object`*. It is the most general *`Behavior`*. All other *`Behaviors`* specialize it directly or indirectly.

General Types

Occurrence

Features

enclosedPerformances : Performance [0..*] {subsets timeEnclosedOccurrences}

`timeEnclosedOccurrences` of this Performance that are also Performances.

involvedObjects : Object [0..*]

Objects that are involved in this Performance.

performers : Object [0..*] {subsets involvedObjects}

Objects that enact this performance.

subperformances : Performance [0..*] {subsets enclosedPerformances, suboccurrences}

`enclosedPerformances` that are composite. The default `this` context of a `subperformance` is by default the same as that of its owning Performance. This means that the context for any Performance that is in a composition tree rooted in a Performance that is not itself owned by an Object is the root Performance. If the root Performance is an `ownedPerformance` of an Object, then that Object is the context.

thisPeformance : Performance

The "context" Performance during which this Performance takes place. It defaults to the root of the `subperformances` composition tree. It is the default `dispatchScope` for Performances.

Constraints

None.

9.2.6.2.14 performances

Element

Step

Description

`performances` is the most general feature for Performances of behaviors.

9.2.7 Transfers

9.2.7.1 Transfers Overview

Transfers are *Performances* and *BinaryLinks* that carry *`items`* from their *`source`* *Occurrence* to their *`target`* *Occurrence*. *FlowTransfers* are *Transfers* that start by "picking up" their *`items`* from the *`sourceOutput`* Feature (or one of its redefinitions) of the *`source`* and end with "dropping them off" at the *`targetInput`* Feature of the *`target`* (or one of its redefinitions, see 8.3.3.1.5 about outputs and inputs). *FlowTransfers* do this by specifying the existence of *BinaryLinkObjects* between their *`source`* / *`target`* and values of *`sourceOutput`* / *`targetInput`* Features of those, identified by the Connectors *`sourceOutputLink`* and *`targetOutputLink`*, respectively (these

can be redefined to specialized associations when *FlowTransfer* is used). Each *sourceOutputLink* identifies an output as its *transferPayload* (one of the values of *sourceOutput* on the *source* at the time a *FlowTransfer* starts) . Each *targetInputLink* identifies an input also as its *transferPayload* (one of the values of *targetInput* on the *target* at the time a *Transfer* ends). Both collections of *transferPayloads* are the same as the *FlowTransfer*'s *items*, and do not change while it is carried out.

Transfers are required to take zero time when their *isInstant* Feature is *true* (*startShot* and *endShot* are the same, see Portions and Time Slices in 9.2.4.1), otherwise they might take time to carry out.

Two Boolean Features of *FlowTransfers* affect timing of their *sourceOutputLinks* and *targetOutputLinks*:

- *isMove true* requires *sourceOutputLinks* to end (cease to exist) when the *Transfer* starts, otherwise the *Transfer* has no effect on the *sourceOutputLinks*.
- *isPush true* requires the *Transfer* to start when its *sourceOutputLinks* do (begin to exist), otherwise the *Transfer* can start anytime after the *sourceOutputLinks* do.

MessageTransfers are *Transfers* that do not have the additional capabilities of FlowTransfers. *SendPerformances* and *AcceptPerformances* are *Performances* for specifying when *MessageTransfers* come into and go out of *Occurrences*, respectively. *SendPerformances* require a *MessageTransfer* as *outgoingTransferFromSelf* from a designated `sender` (defaulting to *this*, see 9.2.4.2.14), carrying a *sentItem*, optionally to a designated *receiver*. *AcceptPerformances* require an *incomingTransferToSelf* to a designated *receiver* (defaulting to *this*), carrying an *acceptedItem*.

Transfer and its specializations are binary Interactions, while *transfers* is the most general Feature typed by *Transfer* or its specializations, and the most general ItemFlow (see 8.3.4.9). *Transfer* is not the most general binary Interaction, and *transfers* is not the most general feature typed by binary Interactions, because binary Interactions can include more than one ItemFlow, as well as other Interactions.

ItemFlow's `itemType` gives the kind of things being transferred (most generally the type of *item*, above). For *FlowTransfers*, ItemFlow's `sourceOutputFeature` and `targetInputFeature` specify which Features of its connected Feature *Occurrences* identify outputs and inputs, respectively (most generally *sourceOutput* and *targetInput* above, respectively).

9.2.7.2 Elements

9.2.7.2.1 AcceptPerformance

Element

Behavior

Description

AcceptPerformances are Performances that require an `incomingTransferToSelf` of a designated `receiver` Occurrence (defaulting to `this`), providing an `acceptedItem` as output.

General Types

Performance

Features

acceptedItem : Anything [0..*]

acceptedTransfer : MessageTransfer [0..1] {subsets receiver.incomingTransfersToSelf}

receiver : Occurrence

receiver.incomingTransfersToSelf : Transfer [0..*]

Constraints

None.

9.2.7.2.2 FlowTransfer

Element

Interaction

Description

A FlowTransfer is a Transfer identifying an output feature of the `source` to pick up items from and an input feature of the `target` to drop them off. They can start when items are available at the `source` and move or copy them to the `target`.

General Types

Transfer

9.2.8 Feature Referencing Performances

9.2.8.1 Feature Referencing Performances Overview

The *`FeatureReferencingPerformances`* package defines Behaviors used to read and write values of a referenced Feature of an Occurrence as of the time the Performance of the Behavior ends.

9.2.8.2 Elements

9.2.8.2.1 BooleanEvaluationResultMonitorPerformance

Element

Description

A BooleanEvaluationResultMonitorPerformance is a EvaluationResultMonitorPerformance that waits for changes in the `result` of a BooleanEvaluation identified by `onOccurrence`.

General Types

EvaluationResultMonitorPerformance

Features

afterValues : Boolean {redefines afterValues}

beforeValues : Boolean {redefines beforeValues}

monitoredOccurrence : BooleanEvaluation {subsets timeSlices, redefines monitoredOccurrence}

A `timeSlice` of `onOccurrence` during which its values for `result` change.

onOccurrence : BooleanEvaluation {redefines onOccurrence}

The BooleanEvaluation being monitored for changes in its `result` values.

result : Boolean {redefines result, nonunique}

Redefines BooleanEvaluation::`result` and`monitoredFeature`.

Constraints

None.

9.2.8.2.2 BooleanEvaluationResultToMonitorPerformance

Element

Description

A BooleanEvaluationResultToMonitorPerformance is a FeatureReferencingPerformance that waits for the `result` of a BooleanEvaluation (identified by `onOccurrence`) to change to either true or false, as indicated by `isToTrue` (defaulting to true). If the `result` is already true (or false), the performance waits for the `result` to become false (or true) before waiting again for it to change back.

General Types

FeatureReferencingPerformance

Features

afterValues : Boolean {redefines values, nonunique}

The values of `monitoredFeature` for `onOccurrence` immediately after they change. Always the same as `isToTrue`.

endWhen : HappensJustBefore

See FeatureMonitorPerformance::`endWhen`. It is restricted to HappensJustBefore in `monitor1` and `monitor2`.

isToTrue : Boolean

monitor1 : BooleanEvaluationResultMonitorPerformance

Waits for the `result` of `onOccurrence` to change.

monitor2 : BooleanEvaluationResultMonitorPerformance [0..1]

Waits for the `result` of `onOccurrence` to change again, only if the change detected by `monitor1` was not the same as `isToTrue`.

onOccurrence : BooleanEvaluation {redefines onOccurrence}

The BooleanEvaluation being monitored for changes in its `result` values.

Constraints

bertmpMonitor1ElseMonitor2

[no documentation]

```
isEmpty(monitor2) == (monitor1.afterValues == isToTrue)
```

9.2.8.2.3 EvaluationResultMonitorPerformance

Element

Behavior

Description

An EvaluationResultMonitorPerformance is a FeatureMonitorPerformance that waits for changes in `result` of an Evaluation identified by `onOccurrence`. The Predicate being evaluated must be able to produce multiple `results` over time, for example by only using Binding (SelfLink) Connectors between Steps, rather than Successions or ItemFlows, including in its Step `behaviors`.

General Types

FeatureMonitorPerformance

Features

monitoredOccurrence : Evaluation {subsets timeSlices, redefines monitoredOccurrence}

A `timeSlice` of `onOccurrence` during which its values for `result` change.

onOccurrence : Evaluation {redefines onOccurrence}

The Evaluation being monitored for changes in its `result` values.

result : Anything [0..*] {redefines monitoredFeature, nonunique}

Redefines Evaluation::`result` and `monitoredFeature`.

Constraints

None.

9.2.8.2.4 FeatureAccessPerformance

Element

Behavior

Description

A FeatureAccessPerformance is a FeatureReferencingPerformance where `values` are all the values of `accessedFeature` for `onOccurrence` at the time the Performance ends. Specializations or usages of this narrow `accessedFeature` to particular features.

General Types

FeatureReferencingPerformance

Features

accessedFeature : Anything [0..*] {nonunique}

Feature of `onOccurrence` that has `values` at the time this FeatureAccessPerformance ends.

startingAt : Occurrence {subsets timeSlices}

A `timeslice` of `onOccurrence` that starts when this FeatureAccessPerformance ends.

Constraints

None.

9.2.8.2.5 FeatureMonitorPerformance

Element

Behavior

Description

A FeatureMonitorPerformance is a FeatureReferencingPerformance that waits for values of `monitoredFeature` to change on `onOccurrence` from what they were when the performance started. The values before and after the change are given by `beforeValues` and `afterValues`

General Types

FeatureReferencingPerformance

Features

afterSnapshot : Occurrence {subsets snapshots}

A `snapShot` of `monitoredOccurrence` just after its values for `monitoredFeature` change.

afterValues : Anything [0..*] {redefines values}

The values of `monitoredFeature` for `monitoredOccurrence` immediately after they change

beforeTimeSlice : Occurrence {subsets timeSlices}

A `timeSlice` of `monitoredOccurrence`, starting at the same time, and ending just before its values for `monitoredFeature` change.

beforeValues : Anything [0..*]

The values of `monitoredFeature` for `monitoredOccurrence` before any change

endWhen : HappensBefore

Succession (Connector typed by HappensBefore) from `afterSnapshot` to the `endShot` of this FeatureMonitorPerformance. Can be specialized to specify how soon the performance should end after the change in `monitoredFeature`.

monitoredFeature : Anything [0..*] {nonunique}

The Feature being monitored for changes in values on `monitoredOccurrence`.

monitoredOccurrence : Occurrence {subsets timeSlices}

A `timeSlice` of `onOccurrence`, starting when this FeatureMonitorPerformance starts, during which the values of `monitoredFeature` change.

Constraints

fmpBeforeAfterValuesNotSame

[no documentation]

```
not beforeValues == afterValues
```

9.2.8.2.6 FeatureReadEvaluation

Element

Function

Description

A FeatureReadEvaluation is a FeatureAccessPerformance that is a Function providing as its result the values of `accessedFeature` of `onOccurrence` at the time the evaluation ends.

General Types

Evaluation
FeatureAccessPerformance

Features

result : Anything [0..*] {redefines result, values, nonunique}

Values of the Feature being accessed, as an `out` parameter.

Constraints

None.

9.2.8.2.7 FeatureReferencingPerformance

Element

Behavior

Description

A FeatureReferencingPerformance is a Performance generalizing other Behaviors relating to `values` of a Feature of `onOccurrence`, as specified in the specialized Behaviors.

General Types

Performance

Features

onOccurrence : Occurrence

An Occurrence that has `values` for a Feature determined in specializations of this behavior.

values : Anything [0..*] {nonunique}

Values of a Feature of `onOccurrence`, determined in specializations of this Behavior.

Constraints

None.

9.2.8.2.8 FeatureWritePerformance

Element

Behavior

Description

A FeatureWritePerformance is a FeatureAccessPerformance that ensures the values of of `onOcurrence` are exactly the `replacementValues` at the time the performance ends.

General Types

FeatureAccessPerformance

Features

replacementValues : Anything [0..*] {redefines values, nonunique}

Values of the Feature being accessed, as an `inout` parameter to replace all the values.

Constraints

None.

9.2.9 Control Performances

9.2.9.1 Control Performances Overview

The *ControlPerformances* package defines Behaviors used to type Steps that control the sequencing of performance of other Steps, including the following.

DecisionPerformances are *Performances* used by ("decision") Steps to ensure that each *DecisionPerformance* (value) of the Step is the `earlierOccurrence` of exactly one *HappensBefore* link of the Successions going out of the Step. Successions going out of `steps` typed by *DecisionPerformance* or its specializations must:

- have connector end multiplicities of 1 towards the Step, and 0..1 away from it.
- subset a Feature of its `featuringBehavior` derived as a chain of the Step and `DecisionPerformance::outgingHBLink` (see also 7.3.4.6 on feature chaining).

MergePerformances are *Performances* used by ("merge") Steps to ensure that each *MergePerformance* (value) of the Step is the `laterOccurrence` of exactly one *HappensBefore* link of the Successions coming into the step. Successions coming into `steps` typed by MergePerformance or its specializations must:

- have connector end multiplicities of 1 towards the Step, and 0..1 away from it.
- subset a Feature of its `featuringBehavior` derived as a chain of the Step and `MergePerformance::incomingHBLink`.

IfPerformances are *Performances* that determine whether one or more clauses occur based on the value of a Boolean argument. The concrete specializations of *IfPerformance* are *IfThenPerformance, IfElsePerformance* and *IfThenElsePerformance.*

LoopPerformances are *Performances* that whose body occurs iteratively as determined by Boolean "while" and "until" conditions.

9.2.9.2 Elements

9.2.9.2.1 DecisionPerformance

Element

Behavior

Description

A DecisionPerformance is a Performance that represents the selection of one of the Successions that have the DecisionPerforance behavior as their source. All such Successions must subset the `outgoingHBLink` feature of the source DecisionPerformance. For each instance of DecisionPerformance, the `outgoingHBLink` is an instance of exactly one of the Successions, ordering the DecisionPerformance as happening before an instance of the target of that Succession.

General Types

Performance

Features

outgoingHBLink : HappensBefore

Constraints

None.

9.2.9.2.2 IfElsePerformance

Element

Behavior

Description

An IfElsePerformance is an IfPerformance where `else` occurs after and only after the `ifTest` Evaluation `result` is not true.

General Types

IfPerformance

Features

elseClause : Occurrence [0..1]

Constraints

None.

9.2.9.2.3 IfPerformance

Element

Behavior

Description

An IfPerformance is a Performance that determines whether the `if` Evaluation `result` is true (by whether the `ifTrue` connector has a value).

General Types

Performance

Features

ifTest : BooleanEvaluation

trueLiteral : LiteralEvaluation

Constraints

None.

9.2.9.2.4 IfThenElsePerformance

Element

Behavior

Description

An IfThenElsePerformance is an IfThenPerformance and an IfElsePerformance.

General Types

IfElsePerformance
IfThenPerformance

Features

None.

Constraints

None.

9.2.9.2.5 IfThenPerformance

Element

Behavior

Description

An IfThenPerformance is an IfPerformance where `then` occurs after and only after the `if` Evaluation `result` is true.

General Types

IfPerformance

Features

thenClause : Occurrence [0..1]

Constraints

None.

9.2.9.2.6 LoopPerformance

Element

Behavior

Description

A LoopPerformance is a Performance where `body` occurs repeatedly in sequence (iterates) as long as the `while` evaluation result is true before each iteration (and after the previous one, except the first time) and the `until` evaluation result is not true after each iteration and before the next one (except the last one).

General Types

Performance

Features

body : Occurrence [0..*]

untilDecision : IfElsePerformance [0..*]

untilTest : BooleanEvaluation [0..*]

whileDecision : IfThenPerformance [1..*]

whileTest : BooleanEvaluation [1..*]

Constraints

None.

9.2.9.2.7 MergePerformance

Element

Behavior

Description

A MergePerformance is a Performance that represents the merging of all Successions that target the MergePerforance behavior. All such Successions must subset the `incomingHBLink` feature of the target MergePerformance. For each instance of MergePerformance, the `incomingHBLink` is an instance of exactly one of the Successions, ordering the MergePerformance as happening after an instance of the source of that Succession.

General Types

Performance

Features

incomingHBLink : HappensBefore

Constraints

None.

9.2.10 State Performances

9.2.10.1 State Performances Overview

The *StatePerformance* package contains a library model for the semantics of state-based behavior, including *StatePerformances* and *StateTransitionPerformances*.

StatePerformances are *DecisionPerformances* (see 9.2.9.1) that

- only have Steps defined in this library, or specialized from them.
- can identify *Transfers* that might be followed by taking the last of the above Steps (see `exit` below).

Usages of *StatePerformance* can specialize its library-defined Steps to specify how they are carried out, as well as how the *Transfers* above are identified. Any Behavior can use (have `steps` typed by) *StatePerformances*, not only "state machines".

The *StatePerformance* Steps defined in this library are:

- `entry` [1]: happens before all *Performances* of `middle`.
- `middle` [1..*]: happen before the `exit` *Performance* (see below). Additional modeler-defined Steps must subset this one.
- `do` [1]: a `middle` *Performance* that starts before the others.
- `exit` [1]: happens after the end of *Transfers* identified by the *StatePerformance* (see `acceptable` below).

StatePerformances identify *Transfers* that happen before (potentially "trigger") their `exit` with these Features:

- `acceptable` [*]: candidates for being identified as `accepted`.
- `accepted` [0..1]: one of the `acceptable` transfers that enables `exit` to start. This must have a value if `acceptable` does.

StatePerformances can employ any method of identifying `acceptable` *Transfers*, one being to have them determined by other Steps typed by *StateTransitionPerformances* that are connected to Successions (see 8.3.4.5) going out of a *StatePerformance* Step (as in "state machines"). These are *TransitionPerformances* (see 9.2.11.1) that have a *StatePerformance* as their `transitionLinkSource`. They identify *MessageTransfers* (see 9.2.7.1) with these Features:

- `acceptable` [*]: candidates for being identified as `trigger`. This subsets `acceptable` of the `transitionLinkSource`.
- `trigger` [0..1]: one of the `acceptable` transfers. This subsets `accepted` of the `transitionLinkSource`.

Subsetting the Features above from the corresponding ones in the `transitionLinkSource` enables a *StatePerformance* Step to constrain all the *StateTransitionPerformance*s Steps connected to its outgoing Successions, including to decide which of the *MessageTransfers* `acceptable` to those Steps will be `accepted` by the *StatePerformance* and `trigger` which Succession (which will have a *HappenBeforeLink* value).

Some Features of *Occurrences* in general are used by *StatePerformances* composed under them for constraints sometimes needed in state machines:

- `incomingTransferSort` determines which *Transfer* should be `accepted` when multiple are `acceptable` ones, by comparing two *Transfers* at a time. It defaults to `earlierFirstIncomingTransferSort` for *Occurrences*, including *StatePerformances*, which is `true` if the first *Transfer* ends (arrives) before the other.
- `isTriggerDuring` being `true` requires `accepted` *Transfers* to end (arrive) during the *StatePerformance*. Otherwise, *StateTransitionPerformances* can optionally require the same of `triggers` with respect to their `transitionLinkSource`.
- `isDispatch` being `true` prevents the same *Transfer* from being `accepted` more than once by *StatePeformances* composed under `dispatchScope`, and prevents from being `accepted` at all any `acceptable` *Transfers* that are not `accepted` and are higher in `incomingTransferSort` order than the one that is. It defaults to `true` for *Performances*, including *StatePerformances*, and `false` for other *Occurrences*, while `dispatchScope` defaults to `thisPerformance` for *StatePerformances*, the top *Performance* (indirectly) composing the *StatePerformance* (see 9.2.6.2.13), and `self` for other *Occurrences* (see 9.2.2.1).
- `isRunToCompletion` being `true` prevents *TransitionPerformances* composed under `runToCompletionScope` from happening during `entry`. It defaults to the same as it is on `this` for *StatePerformances*, the *Object* directly composing `thisPerformance`, or `thisPerformance` if there is none (see 9.2.4.2.14), and `true` for other *Occurrences*, while `runToCompletionScope` defaults to the same as it is on `this` for *StatePerformances*, and `self` for other *Occurrences*.

StateTransitionPeformances also require their `guards` to happen after the `nonDoMiddle` Step of the `transitionLinkSource` (all the `middle` *Performances* except for `do`) and before the `exit` Step (compare to *NonStateTransitionPerformances* in 9.2.11.1).

9.2.10.2 Elements

9.2.10.2.1 StatePerformance

TransitionPerformance

Features

acceptable : MessageTransfer [0..*] {subsets triggerTarget.incomingTransfersToSelf, transitionLinkSource.acceptable}

isTriggerDuring : Boolean

transitionLinkSource : StatePerformance {redefines transitionLinkSource}

transitionLinkSource.acceptable : MessageTransfer [0..*]

transitionLinkSource.accepted : MessageTransfer [0..1]

trigger : MessageTransfer [0..1] {subsets acceptable, transitionLinkSource.accepted, redefines trigger}

triggerTarget.incomingTransfersToSelf : Transfer [0..*]

Constraints

None.

9.2.11 Transition Performances

9.2.11.1 Transition Performances Overview

The *TransitionPerformances* package contains a library model of the semantics of conditional transitions between *Occurrences*, including the performance of specified Behaviors when the transition occurs.

TransitionPerformances are *Performances* used to

- determine whether a Succession (see 8.3.4.5) going out of an *Occurrence* Feature (`Succession::sourceFeature`) has values (*HappensBefore* links), based on values of `sourceFeature` (*Occurrences*) and other conditions, including ending of *Transfers*.
- perform specified Behaviors for each value of the Succession above.

The Succession constrained by a *TransitionPerformance* is specified by a Connector between the Succession and its `transitionStep`, a unique Step typed by *TransitionPerformance* or a specialization of it, of the same Behavior as the Succession. This connector is

- typed by an Association defined to give a value to the *transitionLink* of *TransitionPerformances*,
- has connector end multiplicity 0.1 on the Succession end and 1 on the *TransitionPerformance* Step end.

The connector end multiplicities above ensure every *HappensBefore* link of the Succession is paired with a unique *TransitionPerformance* that has its conditions satisfied for that *Link*, while all the other *TransitionPerformances* of `transitionStep` fail their conditions and have no values for *`transitionLink`*.

The `transitionStep` above is also connected to the Succession's `sourceFeature`, because conditions on the Succession depend on each *Occurrence* of its `sourceFeature` separately, which *TransitionPerformances* identify as their *`transitionLinkSource`*. This connector is

- typed by an Association defined to give a value to the *`transitionLinkSource`* of *TransitionPerformances*.
- with connector end multiplicity 1 on both ends.

The connector end multiplicities above ensure every *Occurrence* of the Succession's `sourceFeature` is paired with a unique *TransitionPerformance*, and vice-versa, that determines whether the Succession has a value (*HappensBefore* link) for that *Occurrence*.

TransitionPerformances with a `transitionLink` must satisfy these conditions:

- identify at least one *Transfer* as `trigger` that `targets triggerTarget`.
- all *Transfers* identified by `trigger` must happen before all *Evaluations* identified by `guard`.
- all *Evaluations* identified by `guard` must have `result` value `true`.

The `effect` of a *TransitionPerformance* can have values (*Performances*) only if the above conditions hold. The `effect` *Performances* must happen after the `guards` and before the `laterOccurrence` of `transitionLink`.

Usages of (Steps typed by) *TransitionPerformance* or its specializations can redefine or subset `guard` and `effect` to specify how they are carried out, as well as specify how `triggers` are identified. These usages can

- be `steps` of any Behavior (not only "state machines"), as well as constrain Successions going out of any kind of Step (not only those identifying *StatePerformances*, see 9.2.10.1).
- employ any method of identifying `triggers`, including requiring none at all, as well as constraining *Transfer* `targets` to be, for example, the *StatePerformance* itself, or a *Performance* it is a `subperformance` of, or an *Object* enacting that *Performance*.

TransitionPerformances are either *StateTransitionPerformances* or *NonStateTransitionPerformances*, depending on whether the `transitionLinkSource` is a *StatePerformance* or not. Both ensure `guards` happen before the `laterOccurrence` of `transitionLink`, in case there are no `effects`, but do this in different ways. *NonStateTransitionPerformances* require their `guards` to happen after `transitionLinkSource` (see 9.2.10.1 about StateTransitionPerformances).

9.2.11.2 Elements

9.2.12 Clocks

9.2.12.1 Clocks Overview

This package models *Clocks* that provide an advancing numerical reference usable for quantifying the time of an *Occurrence*.

9.2.12.2 Elements

9.2.12.2.1 BasicClock

Element

Structure

Description

A *BasicClock* is a *Clock* whose *currentTime* is a *Real* number.

General Types

Clock

Features

currentTime : Real {redefines currentTime}

Constraints

None.

9.2.12.2.2 BasicDurationOf

Element

Function

Description

BasicDurationOf returns the *DurationOf* an *Occurrence* as a *Real* number relative to a *BasicClock*.

General Types

DurationOf

Features

clock : BasicClock {redefines clock}

Default is inherited *Occurrence::localClock*.

duration : Real {redefines duration}

o : Occurrence {redefines o}

Constraints

None.

9.2.12.2.3 BasicTimeOf

Element

Function

Description

BasicTimeOf returns the *TimeOf* an *Occurrence* as a *Real* number relative to a *BasicClock*.

General Types

TimeOf

Features

clock : BasicClock {redefines clock}

Default is inherited *Occurrence::localClock*.

o : Occurrence {redefines o}

timeValue : Real {redefines timeInstant}

Constraints

None.

9.2.12.2.4 Clock

Element

Structure

Description

A *Clock* provides a scalar *currentTime* that advances montonically over its lifetime. *Clock* is an abstract base Structure that can be specialized for different kinds of time quantification (e.g., discrete time, continuous time, time with units, etc.).

General Types

Object

Features

currentTime : NumericalValue

A numerical time reference that advances over the lifetime of the *Clock*.

Constraints

timeFlowConstraint

The *currentTime* of a snapshot of a *Clock* is equal to the *TimeOf* the snapshot relative to that *Clock*.

9.2.12.2.5 DurationOf

Element

Function

Description

DurationOf returns the duration of a given *Occurrence* relative to a given *Clock*, which is equal to the *TimeOf* the end snapshot of the *Occurrence* minus the *TimeOf* its start snapshot.

General Types

Evaluation

Features

clock : Clock

Default is inherited *Occurrence::localClock*.

duration : NumericalValue

o : Occurrence

Constraints

None.

9.2.12.2.6 TimeOf

Element

Function

Description

TimeOf returns a scalar *timeValue* for a given *Occurrence* relative to a given *Clock*. The *timeValue* is the time of the start of the *Occurrence*, which is considered to be synchronized with the snapshot of the *Clock* with a *currentTime*timeValue.

General Types

Evaluation

Features

clock : Clock

Default is inherited *Occurrence::localClock*.

o : Occurrence

timeInstant : NumericalValue

Constraints

timeContinuityConstraint

If one *Occurrence* happens immediately before another, then the *TimeOf* the end snapshot of the first Occurrence equals the *TimeOf* the second *Occurrence*.

startTimeConstraint

The *TimeOf* an *Occurrence* is equal to the time of its start snapshot.

timeOrderingConstraint

If one *Occurrence* happens before another, then the *TimeOf* the end snapshot of the first *Occurrence* is no greater than the *TimeOf* the second *Occurrence*.

9.2.12.2.7 universalClock

Element

Feature

Description

universalClock is a single *Clock* that can be used as a default universal time reference.

General Types

Clock
objects

Features

None.

Constraints

None.

9.2.13 Observation

9.2.13.1 Observation Overview

This package models a framework for monitoring *Boolean* conditions and notifying registered observers when they change from false to true.

9.2.13.2 Elements

9.2.13.2.1 CancelObservation

Element

Behavior

Description

Cancel all observations of a given *ChangeSignal* for a given *Occurrence*.

General Types

Performance

Features

observer : Occurrence

signal : ChangeSignal

Constraints

None.

9.2.13.2.2 changeCondition

Element

Expression

Description

General Types

None.

Features

None.

Constraints

None.

9.2.13.2.3 ChangeMonitor

Element

Structure

Description

A *ChangeMonitor* is a collection of ongoing *ChangeSignal* observations for various observer *Occurrences*. It provides convenient operations for starting and canceling the observations it manages.

General Types

Object

Features

cancelObservation : CancelObservation [0..*]

Cancel all observations of a given *ChangeSignal* for a given *Occurrence*.

observations : ObserveChange [0..*]

startObservation : StartObservation [0..*]

Start an observation of a given *ChangeSignal* for a given *Occurrence*.

Constraints

None.

9.2.13.2.4 ChangeSignal

Element

Structure

Description

A *ChangeSignal* is a signal to be sent when the *Boolean* result of its *changeCondition* Expression changes from false to true.

General Types

Object

Features

changeMonitor : ChangeMonitor

The *ChangeMonitor* responsible for monitoring the *signalCondition.*

signalCondition : BooleanEvaluation

A BooleanExpression whose result is being monitored.

Constraints

None.

9.2.13.2.5 defaultMonitor

Element

Feature

Description

defaultMonitor is a single *ChangeMonitor* that can be used as a default.

General Types

ChangeMonitor
objects

Features

None.

Constraints

None.

9.2.13.2.6 ObserveChange

Element

Behavior

Description

Each *Performance* of *ObserveChange* waits for the result of the *Boolean changeCondition* of a given *ChangeSignal* to change from false to true, and, when it does, sends the *ChangeSignal* to a given observer *Occurrence*.

General Types

Performance

Features

changeObserver : Occurrence

changeSignal : ChangeSignal

transfer : TransferBefore [0..1]

After waiting for the condition change (if necessary), then send *changeSignal* to *changeObserver*.

wait : IfThenPerformance

If the result of the *changeSignal.signalCondition* is false, then wait for it to become true:

```
in ifTest { not changeSignal.signalCondition() }
in thenClause : BooleanEvaluationResultToMonitorPerformance {
    in onOccurrence = changeSignal.signalCondition;
}
```

Constraints

None.

9.2.13.2.7 StartObservation

Element

Behavior

Description

Start an observation of a given *ChangeSignal* for a given *Occurrence*.

General Types

Performance

Features

observer : Occurrence

signal : ChangeSignal

Constraints

None.

9.2.14 Triggers

9.2.14.1 Triggers Overview

This package contains functions that return *ChangeSignals* for triggering when a *Boolean* condition changes from false to true, at a specific time or after a specific time delay.

9.2.14.2 Elements

9.2.14.2.1 TimeSignal

Element

Structure

Description

A *TimeSignal* is a *ChangeSignal* whose condition is the *currentTime* of a given *Clock* reaching a specific *signalTime*.

General Types

ChangeSignal

Features

signalClock : Clock

The *Clock* whose *currentTime* is being monitored.

signalCondition : BooleanEvaluation {redefines signalCondition}

The *Boolean* condition of the *currentTime* of the *signalClock* being equal to the *signalTime*.

signalTime : NumericalValue

The time at which the *TimeSignal* should be sent.

Constraints

None.

9.2.14.2.2 TriggerAfter

Element

Function

Description

TriggerAfter returns a monitored *TimeSignal* to be sent to a *receiver* after a certain time *delay* relative to a given *Clock*.

General Types

Evaluation

Features

clock : Clock

The *Clock* to be used as the reference for the time *delay*. The default is the *localClock*, which will be bound when the function is invoked.

delay : NumericalValue

The time duration, relative to the *clock*, after which the *TimeSignal* is sent.

monitor : ChangeMonitor

The *ChangeMonitor* to be used to monitor the *TimeSignal* condition. The default is the *Observation::defaultMonitor*.

receiver : Occurrence

The *Occurrence* to which the *TimeSignal* is to be sent.

signal : TimeSignal

Constraints

None.

9.2.14.2.3 TriggerAt

Element

Function

Description

TriggerAt returns a monitored *TimeSignal* to be sent to a *receiver* when the *currentTime* of a given *Clock* reaches a specific *time*.

General Types

Evaluation

Features

clock : Clock

The *Clock* to be used as the reference for the *timeInstant*. The default is the *localClock*, which will be bound when the function is invoked.

monitor : ChangeMonitor

The *ChangeMonitor* to be used to monitor the *TimeSignal* condition. The default is the *Observation::defaultMonitor*.

receiver : Occurrence

The *Occurrence* to which the *TimeSignal* is to be sent.

signal : TimeSignal

timeInstant : NumericalValue

The time instant, relative to the *clock*, at which the *TimeSignal* should be sent.

Constraints

None.

9.2.14.2.4 TriggerWhen

Element

Function

Description

TriggerWhen returns a monitored *ChangeSignal* for a given *condition*, to be sent to a given *receiver* when the *condition* occurs.

General Types

Evaluation

Features

condition : BooleanEvaluation

The BooleanExpression to be monitored for changing from false to true.

monitor : ChangeMonitor

The *ChangeMonitor* to be used to monitor the *ChangeSignal* condition. The default is the *Observation::defaultMonitor*.

receiver : Occurrence

The *Occurrence* to which the *ChangeSignal* is to be sent.

signal : ChangeSignal

Constraints

None.

9.2.15 SpatialFrames

9.2.15.1 SpatialFrames Overview

This package models spatial frames of reference for quantifying the position of points in a three-dimensional space.

9.2.15.2 Elements

9.2.15.2.1 CartesianCurrentDisplacementOf

Element

Function

Description

The *CurrentDisplacementOf* two Points relative to a *CartesianSpatialFrame* is a *CartesianThreeVectorValue*.

General Types

CurrentDisplacementOf

Features

clock : Clock {redefines clock}

displacementVector : CartesianThreeVectorValue {redefines displacementVector}

frame : CartesianSpatialFrame {redefines frame}

point1 : Point {redefines point1}

point2 : Point {redefines point2}

Constraints

None.

9.2.15.2.2 CartesianCurrentPositionOf

Element

Function

Description

The *CurrentPositionOf* a Point relative to a *CartesianSpatialFrame* is a *CartesianThreeVectorValue*.

General Types

CurrentPositionOf

Features

clock : Clock {redefines clock}

Defaults to the *localClock* of the *frame*.

frame : CartesianSpatialFrame {redefines frame}

point : Point {redefines point}

positionVector : CartesianThreeVectorValue {redefines positionVector}

Constraints

None.

9.2.15.2.3 CartesianDisplacementOf

Element

Function

Description

The *DisplacementOf* two Points relative to a *CartesianSpatialFrame* is a *CartesianThreeVectorValue*.

General Types

DisplacementOf

Features

clock : Clock {redefines clock}

Defaults to the *localClock* of the *frame*.

displacementVector : CartesianThreeVectorValue {redefines displacementVector}

frame : CartesianSpatialFrame {redefines frame}

point1 : Point {redefines point1}

point2 : Point {redefines point2}

time : NumericalValue {redefines time}

Constraints

None.

9.2.15.2.4 CartesianPositionOf

Element

Function

Description

The *PositionOf* a Point relative to a *CartesianSpatialFrame* is a *CartesianThreeVectorValue*.

General Types

PositionOf

Features

clock : Clock {redefines clock}

Defaults to the *localClock* of the *frame*.

frame : CartesianSpatialFrame {redefines frame}

point : Point {redefines point}

positionVector : CartesianThreeVectorValue {redefines positionVector}

time : NumericalValue {redefines time}

Constraints

None.

9.2.15.2.5 CartesianSpatialFrame

Element

Structure

Description

A *CartesianSpatialFrame* is a *SpatialFrame* relative to which all position and displacement vectors can be represented as *CartesianThreeVectorValues*.

General Types

SpatialFrame

Features

None.

Constraints

None.

9.2.15.2.6 CurrentDisplacementOf

Element

Function

Description

The *CurrentDisplacementOf* two *Points* relative to a *SpatialFrame* and *Clock* is the *DisplacementOf* the *Points* relative to the *SpacialFrame* at the *currentTime* of the *Clock*.

General Types

Evaluation

Features

clock : Clock

Defaults to the *localClock of the frame*.

displacementVector : ThreeVectorValue

frame : SpatialFrame

point1 : Point

point2 : Point

Constraints

None.

9.2.15.2.7 CurrentPositionOf

Element

Function

Description

The *CurrentPositionOf* a *Point* relative to a *SpatialFrame* and a *Clock* is the *PositionOf* the *Point* relative to the *SpatialFrame* at the *currentTime* of the *Clock*.

General Types

Evaluation

Features

clock : Clock

Defaults to the *localClock of the frame*.

frame : SpatialFrame

point : Point

positionVector : ThreeVectorValue

Constraints

None.

9.2.15.2.8 defaultFrame

Element

Feature

Description

defaultFrame is a fixed *SpatialFrame* used as a universal default.

General Types

SpatialFrame

Features

None.

Constraints

None.

9.2.15.2.9 DisplacementOf

Element

Function

Description

The *DisplacementOf* two *Points* relative to a *SpatialFrame*, at a specific *time* relative to a given *Clock*, is the *displacementVector* computed as the difference between the *PositionOf* the first *Point* and *PositionOf* the second *Point*, relative to that *SpatialFrame*, at that *time*.

General Types

Evaluation

Features

clock : Clock

Defaults to the *localClock* of the *frame*.

displacementVector : ThreeVectorValue

frame : SpatialFrame

point1 : Point

point2 : Point

time : NumericalValue

Constraints

zeroDisplacementConstraint

If either *point1* or *point2* occurs within the other, then the *displacementVector* is the zero vector.

```
(point1.spaceTimeEnclosedOccurrences->includes(point2) or
point2.spaceTimeEnclosedOccurrences->includes(point1)) implies
    isZeroVector(displacementVector)
```

9.2.15.2.10 PositionOf

Element

Function

Description

The *PositionOf* a *Point* relative to a *SpatialFrame*, at a specific *time* relative to a given *Clock*, as a *positionVector* that is a *ThreeVectorValue*.

General Types

Evaluation

Features

clock : Clock

Defaults to the *localClock of the frame*.

frame : SpatialFrame

point : Point

positionVector : ThreeVectorValue

time : NumericalValue

Constraints

positionTimePrecondition

The given *point* must exist at the given *time*.

```
TimeOf(point.startShot) <= time and
time <= TimeOf(point.endShot)
```

spacePositionConstraint

The result *positionVector* is equal to the *PositionOf* the *Point spaceShot* of the frame that encloses the given *point*, at the given *time*.

```
(frame.spaceShots as Point)->forAll{in p : Point;
    p.spaceTimeEnclosedOccurrences->includes(point) implies
    positionVector == PositionOf(p, time, frame)
}
```

9.2.15.2.11 SpatialFrame

Element

Structure

Description

General Types

Body

Features

None.

Constraints

None.

9.2.16 Metaobjects

9.2.16.1 Metaobjects Overview

This package defines Metaclasses and Features that are related to the typing of syntactic and semantic metadata.

9.2.16.2 Elements

9.2.16.2.1 Metaobject

Element

Metaclass

Description

A *Metaobject* contains syntactic or semantic information about one or more *annotatedElements*. It is the most general Metaclass. All other Metaclasses must subclassify it directly or indirectly.

General Types

Object

Features

annotatedElement : Element [1..*]

The Elements annotated by this *Metaobject*. This is set automatically when a *Metaobject* is instantiated as the value of a MetadataFeature.

Constraints

None.

9.2.16.2.2 metaobjects

Element

Feature

Description

metaobjects is a specialization of *objects* restricted to type *Metaobject*. It is the most general MetadataFeature. All other MetadataFeatures must subset it directly or indirectly.

General Types

objects
Metaobject

Features

None.

Constraints

None.

9.2.16.2.3 SemanticMetadata

Element

Metaclass

Description

SemanticMetadata is *Metadata* that requires its single *annotatedType* to directly or indirectly specialize a *baseType* that models the semantics for the *annotatedType*.

General Types

Metaobject

Features

annotatedElement : Type {redefines annotatedElement}

The single *annotatedElement* of this SemanticMetadata, which must be a *Type*.

baseType : Type

The required base *Type* for the *annotatedType*.

Constraints

None.

9.2.17 KerML

This package contains a reflective KerML model of the KerML abstract syntax. It is generated from the normative MOF abstract syntax model (see 8.3) as follows.

1. The *KerML* model contains subpackages for *Root*, *Core*, and *Kernel*, but all elements are also imported into the top-level package, so they can be referenced directly from the *KerML* namespace.
2. A metaclass from the MOF model is mapped into a `Metaclass` in the KerML package.
    - The MOF metaclass name is mapped unchanged.
    - Generalizations of the MOF metaclass are mapped to `ownedSpecializations`.
    - All properties from the MOF metaclass are mapped to `features` of the corresponding KerML `Metaclass` (see below). All non-association-end properties are grouped before association-end properties.
3. A property from the MOF model is mapped into a `Feature`.
    - The following feature properties are set as appropriate:
        - `isAbstract = true` if the MOF property is a derived union
        - `isComposite = true` if the MOF property is composite.
        - `isReadonly = true` if the MOF property is read-only.
        - `isDerived = true` if the MOF property is derived.
    - The MOF property name is mapped unchanged.
    - The MOF property type is mapped to an `ownedTyping` relationship.
        - If the MOF property type is a primitive type, the relationship is to the corresponding type from the *ScalarValues* package (see 9.3.2).
        - If the MOF property type is a metaclass, the relationship is to the corresponding reflective `Metaclass`.
    - The MOF property multiplicity is mapped to an owned `MultiplicityRange` with bounds given by `LiteralExpressions`.
    - Subsetted properties from the MOF property are mapped to `ownedSubsettings` of the corresponding reflective `Features`.
    - Redefined properties from the MOF property are mapped to `ownedRedefinitions` of the corresponding reflective `Features`.
    - If the MOF property is `annotatedElement`, then `Metaobject::annotatedElement` is added to the list of redefined properties for the mapping.
4. An enumeration from the MOF model is mapped into a `DataType`.
    - The MOF enumeration name is mapped unchanged.
    - Each enumeration literal from the MOF enumeration is mapped into a `ownedMember Feature` (*not* and `ownedFeature`).
        - The MOF enumeration literal name is mapped unchanged.
        - The member `Feature` is given an owned `MultiplicityRange` of `1..1`.

Note that associations are not mapped from the MOF model and, hence, non-navigable association-owned end properties are not included in the reflective model.

9.3 Data Type Library

9.3.1 Data Types Library Overview

The Data Types Library provides a standard set of commonly used `DataTypes` for scalar, vector and collection values.

9.3.2 Scalar Values

9.3.2.1 Scalar Values Overview

This package contains a basic set of primitive scalar (non-collection) data types. These include *Boolean* and *String* types and a hierarchy of concrete *Number* types, from the most general type of *Complex* numbers to the most specific type of *Positive* integers.

9.3.2.2 Elements

9.3.2.2.1 Boolean

Element

DataType

Description

Boolean is a ScalarValue type whose instances are true and false.

General Types

ScalarValue

Features

None.

Constraints

None.

9.3.2.2.2 Complex

Element

DataType

Description

Complex is the type of complex numbers.

General Types

Number

Features

None.

None.

9.3.2.2.3 Integer

Element

DataType

Description

Integer is the type of mathematical integers, extended with values for positive and negative infinity.

General Types

Rational

Features

None.

Constraints

None.

9.3.2.2.4 Natural

Element

DataType

Description

Natural is the type of non-negative integers, extended with a value for positive infinity.

General Types

DataValue
Integer

Features

None.

Constraints

None.

9.3.2.2.5 Number

Element

DataType

Description

Number is the base type for all NumericalValue types that represent numbers.

General Types

NumericalValue

Features

None.

Constraints

None.

9.3.2.2.6 NumericalValue

Element

DataType

Description

NumericalValue is the base type for all ScalarValue types that represent numerical values.

General Types

ScalarValue

Features

None.

Constraints

None.

9.3.2.2.7 Positive

Element

DataType

Description

Positive is the type of positive integers (not including zero), extended with a value for positive infinity.

General Types

Natural

Features

None.

Constraints

None.

9.3.2.2.8 Rational

Element

DataType

Description

Rational is the type of rational numbers, extended with values for positive and negative infinity.

General Types

Real

Features

None.

Constraints

None.

9.3.2.2.9 Real

Element

DataType

Description

Real is the type of mathematical (extended) real numbers. This includes both rational and irrational numbers, and values for positive and negative infinity.

General Types

Complex

Features

None.

Constraints

None.

9.3.2.2.10 ScalarValue

Element

DataType

Description

A ScalarValue is a DataValue whose instances are considered to be primitive, not collections or structures of other values.

General Types

DataValue

Features

None.

Constraints

None.

9.3.2.2.11 String

Element

DataType

Description

String is a ScalarValue type whose instances are strings of characters.

General Types

ScalarValue

Features

None.

Constraints

None.

9.3.3 Collections

9.3.3.1 Collections Overview

This package defines a standard set of *`Collection`* data types. Unlike sequences of values defined directly using multiplicity, these data types allow for the possibility of collections as elements of collections.

9.3.3.2 Elements

9.3.3.2.1 Array

Element

DataType

Description

An Array is a fixed size, multi-dimensional Collection of which the `elements` are nonunique and ordered. Its `dimensions` specify how many dimensions the array has, and how many elements there are in each dimension. The `rank` is equal to the number of `dimensions`. The `flattenedSize` is equal to the total number of `elements` in the array.

Feature `elements` is a flattened sequence of all elements of an Array and can be accessed by a tuple of indices. The number of indices is equal to `rank`. The `elements` are packed according to row-major convention, as in the C programming language.

Note 1. Feature `dimensions` may be empty, which denotes a zero dimensional array, allowing an Array to collapse to a single element. This is useful to allow for specialization of an Array into a type restricted to represent a scalar. The `flattenedSize` of a zero dimensional array is 1.

Note 2. An Array can also represent the generalized concept of a mathematical matrix of any rank, i.e. not limited to rank two.

General Types

OrderedCollection

Features

dimensions : Positive [0..*] {ordered, nonunique}

flattenedSize : Positive

rank : Natural

Constraints

sizeConstraint

[no documentation]

```
flattenedSize == size(elements)
```

9.3.3.2.2 Bag

Element

DataType

Description

A Bag is a variable size Collection of which the `elements` are unordered and nonunique.

General Types

Collection

Features

None.

Constraints

None.

9.3.3.2.3 Collection

Element

DataType

Description

A Collection is an abstract DataType that represents a collection of elements of a given type.

A Collection is either mutable or immutable, or mutability is unspecified.

TODO: Decide on whether to add Mutability, and if so, how.

General Types

Anything

Features

elements : Anything [0..*] {nonunique}

Constraints

None.

9.3.3.2.4 KeyValuePair

Element

DataType

Description

A KeyValuePair is an abstract DataType that represents a tuple of a `key` and an associated value `val`.

General Types

DataValue

Features

key : Anything

val : Anything

Constraints

None.

9.3.3.2.5 List

Element

DataType

Description

A Sequence is a variable size Collection of which the `elements` are nonunique and ordered.

General Types

OrderedCollection

Features

None.

Constraints

None.

9.3.3.2.6 Map

Element

DataType

Description

A Map is a variable size Collection of which the `elements` are KeyValuePairs. The keys must be unique within in the Map. The values need not be unique.

General Types

UniqueCollection

Features

elements : KeyValuePair [0..*] {redefines elements}

Constraints

None.

9.3.3.2.7 OrderedCollection

Element

DataType

Description

An OrderedCollection is a Collection of which the `elements` are ordered, and not necessarily unique).

General Types

Collection

Features

elements : Anything [0..*] {redefines elements, ordered, nonunique}

Constraints

None.

9.3.3.2.8 OrderedMap

Element

DataType

Description

An OrderedMap is a variable size Map that maintains ordering of its elements.

The ordering may be by key of the KeyValuePair elements, or by order of construction, or any other method. The essential aspect is that ordering is maintained and guaranteed across accesses to the OrderedMap.

General Types

Map
OrderedCollection

Features

elements : KeyValuePair [0..*] {redefines elements, ordered}

Constraints

None.

9.3.3.2.9 OrderedSet

Element

DataType

Description

An OrderedSet is a variable size Collection of which the `elements` are unique and ordered.

General Types

OrderedCollection
UniqueCollection

Features

elements : Anything [0..*] {redefines elements, ordered}

Constraints

None.

9.3.3.2.10 Set

Element

DataType

Description

A Set is a variable size Collection of which the `elements` are unique and unordered.

General Types

UniqueCollection

Features

None.

Constraints

None.

9.3.3.2.11 UniqueCollection

Element

DataType

Description

A UniqueCollection is a Collection of which the `elements` are unique, and not necessarily ordered).

General Types

Collection

Features

elements : Anything [0..*] {redefines elements}

Constraints

None.

9.3.4 Vector Values

9.3.4.1 Vector Values Overview

9.3.4.2 Elements

9.3.4.2.1 CartesianThreeVectorValue

Element

DataType

Description

A *CartesianThreeVectorValue* is a *NumericalVectorValue* that is both Cartesian and has dimension 3.

General Types

ThreeVectorValue
CartesianVectorValue

Features

None.

Constraints

None.

9.3.4.2.2 CartesianVectorValue

Element

DataType

Description

A *CartesianVectorValue* is a *NumericalVectorValue* for which there are specific implementations in *VectorFunctions* of the abstract vector-space functions.

Note: The restriction of the element type to *Real* is to facilitate the complete definition of these functions.

General Types

NumericalVectorValue

Features

elements : Real [0..*] {redefines elements}

Constraints

None.

9.3.4.2.3 NumericalVectorValue

Element

DataType

Description

A *NumericalVectorValue* is a kind of *VectorValue* that is specifically represented as a one-dimensional *Array* of *NumericalValues*. The dimension is allowed to be empty, permitting a *NumericalVectorValue* of rank 0, which is essentially isomorphic to a scalar *NumericalValue*.

General Types

Array
VectorValue

Features

dimension : Positive [0..1] {redefines dimensions}

elements : NumericalValue [0..*] {redefines elements}

Constraints

None.

9.3.4.2.4 ThreeVectorValue

Element

DataType

Description

A *ThreeVectorValue* is a *NumericalVectorValue* that has dimension 3.

General Types

NumericalVectorValue

Features

dimension : Positive [0..*] {redefines elements}

Constraints

None.

9.3.4.2.5 VectorValue

Element

DataType

Description

A *VectorValue* is an abstract data type whose values may be operated on using *VectorFunctions*.

General Types

None.

Features

None.

Constraints

None.

9.4 Function Library

The Function Library includes library models of basic `Functions` that operate on `DataTypes` from the Data Type Library (see 9.3). The KerML operator expression notation translates to invocations of some of these library `Functions`. It is expected that other languages built on KerML will provide additional domain models as needed by their applications, which can include specializations of the library Functions for domain-specific `DataTypes`. The same KerML concrete syntax for `Expressions` can be used with these specialized `Functions` and `DataTypes`, extended with domain-specific semantics.

9.4.1 Function Library Overview

The Function Library includes library models of basic `Functions` that operate on `DataTypes` from the Data Type Library (see 9.3). The KerML operator expression notation translates to invocations of some of these library `Functions`. It is expected that other languages built on KerML will provide additional domain models as needed by their applications, which can include specializations of the library Functions for domain-specific `DataTypes`. The same KerML concrete syntax for `Expressions` can be used with these specialized `Functions` and `DataTypes`, extended with domain-specific semantics.

9.4.2 Base Functions

9.4.2.1 Base Functions Overview

This package defines a basic set of Functions defined on all kinds of values. Most correspond to similarly named operators in the KerML expression notation.

9.4.2.2 Elements

```
abstract function '=='{
    in x: Anything[0..1];
    in y: Anything[0..1];
    return : Boolean[1];
}
function '!='{
    in x: Anything[0..1];
    in y: Anything[0..1];
    return : Boolean[1] = not (x == y);
}

abstract function '==='{
    in x: Anything[0..1];
    in y: Anything[0..1];
    return : Boolean[1];
}

function '!=='{
    in x: Anything[0..1];
    in y: Anything[0..1];
    return : Boolean[1] = not (x === y);
}

function ToString{
    in x: Anything[0..1];
    return : String;
}
```

```
function '['{
    in seq: Anything[0..*] ordered nonunique;
    in index: Anything[0..*] ordered nonunique;
    return : Anything[0..1];
}
function ','{
    in seq1: Anything[0..*] ordered nonunique;
    seq2: Anything[0..*] ordered nonunique;
    return : Anything[0..*] ordered nonunique;
}

abstract function 'all'{
     return : Object[0..*];
}

abstract function 'istype'{
    in seq: Anything[0..*];
    abstract feature 'type': Anything;
    return : Boolean[1];
}

abstract function 'hastype'{
    in seq: Anything[0..*];
    abstract feature 'type': Anything;
    return : Boolean;
}

abstract function '@'{
    in seq: Anything[0..*];
    abstract feature 'type': Anything;
    return : Boolean[1];
}

abstract function '@@'{
    in seq: Metaobject[0..*];
    abstract feature 'type': Metaobject;
    return : Boolean[1];
}

abstract function 'as'{
    in seq: Anything[0..*] ordered nonunique;
    return : Anything[0..*] ordered nonunique;
}

abstract function 'meta'{
    in seq: Metaobject[0..*] ordered nonunique;
    return : Metaobject[0..*] ordered nonunique;
}
```

9.4.3 Data Functions

9.4.3.1 Data Functions Overview

This package defines the abstract base Functions corresponding to all the unary and binary operators in the KerML expression notation that might be defined on various kinds of DataValues.

9.4.3.2 Elements

```
abstract function '+'
    { in x: DataValue[1]; in y: DataValue[0..1]; return : DataValue[1]; }
```

```
abstract function '-'
    { in x: DataValue[1]; in y: DataValue[0..1]; return : DataValue[1]; }
abstract function '*'
    { in x: DataValue[1]; in y: DataValue[1]; return : DataValue[1]; }
abstract function '/'
    { in x: DataValue[1]; in y: DataValue[1]; return : DataValue[1]; }
abstract function '**'
    { in x: DataValue[1]; in y: DataValue[1]; return : DataValue[1]; }
abstract function '^'
    { in x: DataValue[1]; in y: DataValue[1]; return : DataValue[1]; }
abstract function '%'
    { in x: DataValue[1]; in y: DataValue[1]; return : DataValue[1]; }

abstract function 'not'
    { in x: DataValue[1]; return : DataValue[1]; }
abstract function 'xor'
    { in x: DataValue[1]; in y: DataValue[1]; return : DataValue[1]; }

abstract function '~'
    { in x: DataValue[1]; return : DataValue[1]; }
abstract function '|'
    { in x: DataValue[1]; in y: DataValue[1]; return : DataValue[1]; }
abstract function '&'
    { in x: DataValue[1]; in y: DataValue[1]; return : DataValue[1]; }

abstract function '<'
    { in x: DataValue[1]; in y: DataValue[1]; return : Boolean[1]; }
abstract function '>'
    { in x: DataValue[1]; in y: DataValue[1]; return : Boolean[1]; }
abstract function '<='
    { in x: DataValue[1]; in y: DataValue[1]; return : Boolean[1]; }
abstract function '>='
    { in x: DataValue[1]; in y: DataValue[1]; return : Boolean[1]; }

abstract function Max
    { in x: DataValue[1]; in y: DataValue[1]; return : DataValue[1]; }
abstract function Min
    { in x: DataValue[1]; in y: DataValue[1]; return : DataValue[1]; }

abstract function '==' specializes BaseFunctions::'=='
    { in x: DataValue[0..1]; in y: DataValue[0..1]; return : Boolean[1]; }

abstract function '..'
    { in lower: DataValue[1]; in upper: DataValue[1]; return : DataValue[0..*] ordered; }
```

9.4.4 Scalar Functions

9.4.4.1 Scalar Functions Overview

This package defines abstract Functions that specialize the DataFunctions for use with ScalarValues.

9.4.4.2 Elements

```
abstract function '+' specializes DataFunctions::'+'
    { in x: ScalarValue[1]; in y: ScalarValue[0..1]; return : ScalarValue[1]; }
abstract function '-' specializes DataFunctions::'-'
    { in x: ScalarValue[1]; in y: ScalarValue[0..1]; return : ScalarValue[1]; }
abstract function '*' specializes DataFunctions::'*'
    { in x: ScalarValue[1]; in y: ScalarValue[1]; return : ScalarValue[1]; }
```

```
abstract function '/' specializes DataFunctions::'/'
    { in x: ScalarValue[1]; in y: ScalarValue[1]; return : ScalarValue[1]; }
abstract function '**' specializes DataFunctions::'**'
    { in x: ScalarValue[1]; in y: ScalarValue[1]; return : ScalarValue[1]; }
abstract function '^' specializes DataFunctions::'^'
    { in x: ScalarValue[1]; in y: ScalarValue[1]; return : ScalarValue[1]; }
abstract function '%' specializes DataFunctions::'%'
    { in x: ScalarValue[1]; in y: ScalarValue[1]; return : ScalarValue[1]; }

abstract function 'not' specializes DataFunctions::'not'
    { in x: ScalarValue[1]; return : ScalarValue[1]; }
abstract function 'xor' specializes DataFunctions::'xor'
    { in x: ScalarValue[1]; in y: ScalarValue[1]; return : ScalarValue[1]; }

abstract function '~' specializes DataFunctions::'~'
    { in x: ScalarValue[1]; return : ScalarValue[1]; }
abstract function '|' specializes DataFunctions::'|'
    { in x: ScalarValue[1]; in y: ScalarValue[1]; return : ScalarValue[1]; }
abstract function '&' specializes DataFunctions::'&'
    { in x: ScalarValue[1]; in y: ScalarValue[1]; return : ScalarValue[1]; }

abstract function '<' specializes DataFunctions::'<'
    { in x: ScalarValue[1]; in y: ScalarValue[1]; return : Boolean[1]; }
abstract function '>' specializes DataFunctions::'>'
    { in x: ScalarValue[1]; in y: ScalarValue[1]; return : Boolean[1]; }
abstract function '<=' specializes DataFunctions::'<='
    { in x: ScalarValue[1]; in y: ScalarValue[1]; return : Boolean[1]; }
abstract function '>=' specializes DataFunctions::'>='
    { in x: ScalarValue[1]; in y: ScalarValue[1]; return : Boolean[1]; }

abstract function max specializes DataFunctions::Max { in x: ScalarValue[1]; in y: ScalarValue[1]; r
abstract function min specializes DataFunctions::Min { in x: ScalarValue[1]; in y: ScalarValue[1]; r

abstract function '..' specializes DataFunctions::'..' { in lower: ScalarValue[1]; in upper: ScalarV
```

9.4.5 Boolean Functions

9.4.5.1 Boolean Functions Overview

This package defines Functions on Boolean values, including those corresponding to (non-conditional) logical operators in the KerML expression notation.

9.4.5.2 Elements

```
function 'not' specializes ScalarFunctions::'not'
    { in x: Boolean[1]; return : Boolean[1]; }
function 'xor' specializes ScalarFunctions::'xor'
    { in x: Boolean[1]; in y: Boolean[1]; return : Boolean[1]; }

function '|' specializes ScalarFunctions::'|'
    { in x: Boolean[1]; in y: Boolean[1]; return : Boolean[1]; }
function '&' specializes ScalarFunctions::'&'
    { in x: Boolean[1]; in y: Boolean[1]; return : Boolean[1]; }

function '==' specializes DataFunctions::'=='
    { in x: Boolean[0..1]; in y: Boolean[0..1]; return : Boolean[1]; }

function ToString specializes BaseFunctions::ToString
    { in x: Boolean[1]; return : String[1]; }
```

```
function ToBoolean
    { in x: String[1]; return : Boolean[1]; }
```

9.4.6 String Functions

9.4.6.1 String Functions Overview

This package defines Functions on String values, including those corresponding to string concatenation and comparison operators in the KerML expression notation.

9.4.6.2 Elements

```
function '+' specializes ScalarFunctions::'+'
    { in x: String[1]; in y:String[1]; return : String[1]; }

function Length
    { in x: String[1]; return : Natural[1]; }
function Substring
    { in x: String[1]; in lower: Integer[1]; in upper: Integer[1];
      return : String[1]; }

function '<' specializes ScalarFunctions::'<'
    { in x: String[1]; in y: String[1]; return : Boolean[1]; }
function '>' specializes ScalarFunctions::'>'
    { in x: String[1]; in y: String[1]; return : Boolean[1]; }
function '<=' specializes ScalarFunctions::'<='
    { in x: String[1]; in y: String[1]; return : Boolean[1]; }
function '>=' specializes ScalarFunctions::'>='
    { in x: String[1]; in y: String[1]; return : Boolean[1]; }

function '==' specializes DataFunctions::'=='
    { in x: String[0..1]; in y: String[0..1]; return : Boolean[1]; }

function ToString specializes BaseFunctions::ToString
    { in x: String[1]; }
```

9.4.7 Numerical Functions

9.4.7.1 Numerical Functions Overview

This package defines abstract Functions on Numerical values for general arithmetic and comparison operations.

9.4.7.2 Elements

```
abstract function isZero
    { in x: NumericalValue[1]; return : Boolean; }
abstract function isUnit
    { in x : NumericalValue[1]; return : Boolean; }

abstract function abs
    { in x: NumericalValue[1]; return : NumericalValue[1]; }

abstract function '+' specializes ScalarFunctions::'+'
    { in x: NumericalValue[1]; in y: NumericalValue[0..1];
      return : NumericalValue[1]; }
abstract function '-' specializes ScalarFunctions::'-'
    { in x: NumericalValue[1]; in y: NumericalValue[0..1];
      return : NumericalValue[1]; }
abstract function '*' specializes ScalarFunctions::'*'
```

```
    { in x: NumericalValue[1]; in y: NumericalValue[1];
      return : NumericalValue[1]; }
abstract function '/' specializes ScalarFunctions::'/'
    { in x: NumericalValue[1]; in y: NumericalValue[1];
      return : NumericalValue[1]; }
abstract function '**' specializes ScalarFunctions::'**'
    { in x: NumericalValue[1]; in y: NumericalValue[1];
      return : NumericalValue[1]; }
abstract function '^' specializes ScalarFunctions::'^'
    { in x: NumericalValue[1]; in y: NumericalValue[1];
      return : NumericalValue[1]; }
abstract function '%' specializes ScalarFunctions::'%'
    { in x: NumericalValue[1]; in y: NumericalValue[1];
      return : NumericalValue[1]; }

abstract function '<' specializes ScalarFunctions::'<'
    { in x: NumericalValue[1]; in y: NumericalValue[1]; return : Boolean[1]; }
abstract function '>' specializes ScalarFunctions::'>'
    { in x: NumericalValue[1]; in y: NumericalValue[1]; return : Boolean[1]; }
abstract function '<=' specializes ScalarFunctions::'<='
    { in x: NumericalValue[1]; in y: NumericalValue[1]; return : Boolean[1]; }
abstract function '>=' specializes ScalarFunctions::'>='
    { in x: NumericalValue[1]; in y: NumericalValue[1]; return : Boolean[1]; }

abstract function max specializes ScalarFunctions::max
    { in x: NumericalValue[1]; in y: NumericalValue[1];
      return : NumericalValue[1]; }
abstract function min specializes ScalarFunctions::min
    { in x: NumericalValue[1]; in y: NumericalValue[1];
      return : NumericalValue[1]; }

abstract function sum
    { in collection: ScalarValue[0..*]; return : ScalarValue[1]; }
abstract function product
    { in collection: ScalarValue[0..*]; return : ScalarValue[1]; }
```

9.4.8 Complex Functions

9.4.8.1 Complex Functions Overview

This package defines Functions on Complex values, including concrete specializations of the general arithmetic and comparison operations.

9.4.8.2 Elements

```
feature i: Complex[1] = rect(0.0, 1.0);

function rect
    { in re: Real[1]; in im: Real[1]; return : Complex[1]; }
function polar
    { in abs: Real[1]; in arg: Real[1]; return : Complex[1]; }

function re
    { in x: Complex[1]; return : Real[1]; }
function im
    { in x: Complex[1]; return : Real[1]; }

function isZero specializes NumericalFunctions::isZero
    { in x : Complex[1]; return : Boolean[1]; }
function isUnit specializes NumericalFunctions::isUnit
```

```
    { in x : Complex[1]; return : Boolean[1]; }

function abs specializes NumericalFunctions::abs
    { in x: Complex[1]; return : Real[1]; }
function arg
    { in x: Complex[1]; return : Real[1]; }

function '+' specializes NumericalFunctions::'+'
    { in x: Complex[1]; in y: Complex[0..1]; return : Complex[1]; }
function '-' specializes NumericalFunctions::'-'
    { in x: Complex[1]; in y: Complex[0..1]; return : Complex[1]; }
function '*' specializes NumericalFunctions::'*'
    { in x: Complex[1]; in y: Complex[1]; return : Complex[1]; }
function '/' specializes NumericalFunctions::'/'
    { in x: Complex[1]; in y: Complex[1]; return : Complex[1]; }
function '**' specializes NumericalFunctions::'**'
    { in x: Complex[1]; in y: Complex[1]; return : Complex[1]; }
function '^' specializes NumericalFunctions::'^'
    { in x: Complex[1]; in y: Complex[1]; return : Complex[1]; }

function '==' specializes DataFunctions::'=='
    { in x: Complex[0..1]; in y: Complex[0..1]; return : Boolean[1]; }

function ToString specializes BaseFunctions::ToString
    { in x: Complex[1]; return : String[1]; }
function ToComplex
    { in x: String[1]; return : Complex[1]; }

function sum specializes NumericalFunctions::sum
    { in collection: Complex[0..*]; return : Complex[1]; }

function product specializes NumericalFunctions::product
    { in collection: Complex[0..*]; return : Complex[1]; }
```

9.4.9 Real Functions

9.4.9.1 Real Functions Overview

This package defines Functions on Real values, including concrete specializations of the general arithmetic and comparison operations.

9.4.9.2 Elements

```
function re :> ComplexFunctions::re
    { in x: Real[1]; return : Real[1] = x; }
function im :> ComplexFunctions::im
    { in x: Real[1]; return : Real[1] = 0.0; }

function abs specializes ComplexFunctions::abs
    { in x: Real[1]; return : Real[1]; }
function arg specializes ComplexFunctions::arg
    { in x: Real[1]; return : Real[1] = 0.0; }

function '+' specializes ComplexFunctions::'+'
    { in x: Real[1]; in y: Real[0..1]; return : Real[1]; }
function '-' specializes ComplexFunctions::'-'
    { in x: Real[1]; in y: Real[0..1]; return : Real[1]; }
function '*' specializes ComplexFunctions::'*'
    { in x: Real[1]; in y: Real[1]; return : Real[1]; }
function '/' specializes ComplexFunctions::'/'
```

```
    { in x: Real[1]; in y: Real[1]; return : Real[1]; }
function '**' specializes ComplexFunctions::'**'
    { in x: Real[1]; in y: Real[1]; return : Real[1]; }
function '^' specializes ComplexFunctions::'^'
    { in x: Real[1]; in y: Real[1]; return : Real[1]; }

function '<' specializes NumericalFunctions::'<'
    { in x: Real[1]; in y: Real[1]; return : Boolean[1]; }
function '>' specializes NumericalFunctions::'>'
    { in x: Real[1]; in y: Real[1]; return : Boolean[1]; }
function '<=' specializes NumericalFunctions::'<='
    { in x: Real[1]; in y: Real[1]; return : Boolean[1]; }
function '>=' specializes NumericalFunctions::'>='
    { in x: Real[1]; in y: Real[1]; return : Boolean[1]; }

function max specializes NumericalFunctions::max
    { in x: Real[1]; in y: Real[1]; return : Real[1]; }
function min specializes NumericalFunctions::min
    { in x: Real[1]; in y: Real[1]; return : Real[1]; }

function '==' specializes ComplexFunctions::'=='
    { in x: Real[0..1]; in y: Real[0..1]; return : Boolean[1]; }

function sqrt
    { in x: Real[1]; return : Real[1]; }

function floor
    { in x: Real[1]; return : Integer[1]; }
function round
    { in x: Real[1]; return : Integer[1]; }

function ToString specializes ComplexFunctions::ToString
    { in x: Real[1]; return : String[1]; }
function ToInteger
    { in x: Real[1]; return : Integer[1]; }
function ToRational
    { in x: Real[1]; return : Rational[1]; }
function ToReal
    { in x: String[1]; return : Real[1]; }

function sum specializes ComplexFunctions::sum
    { in collection: Real[0..*]; return : Real; }

function product specializes ComplexFunctions::product
    { in collection: Real[0..*]; return : Real; }
```

9.4.10 Rational Functions

9.4.10.1 Rational Functions Overview

This package defines Functions on Rational values, including concrete specializations of the general arithmetic and comparison operations.

9.4.10.2 Elements

```
function rat
    { in numer: Integer[1]; in denum: Integer[1]; return : Rational[1]; }
function numer
    { in rat: Rational[1]; return : Integer[1]; }
function denom
```

```
    { in rat: Rational[1]; return : Integer[1]; }

function abs specializes RealFunctions::abs
    { in x: Rational[1]; return : Rational[1]; }

function '+' specializes RealFunctions::'+'
    { in x: Rational[1]; in y: Rational[0..1]; return : Rational[1]; }
function '-' specializes RealFunctions::'-'
    { in x: Rational[1]; in y: Rational[0..1]; return : Rational[1]; }
function '*' specializes RealFunctions::'*'
    { in x: Rational[1]; in y: Rational[1]; return : Rational[1]; }
function '/' specializes RealFunctions::'/'
    { in x: Rational[1]; in y: Rational[1]; return : Rational[1]; }
function '**' specializes RealFunctions::'**'
    { in x: Rational[1]; in y: Rational[1]; return : Rational[1]; }
function '^' specializes RealFunctions::'^'
    { in x: Rational[1]; in y: Rational[1]; return : Rational[1]; }

function '<' specializes RealFunctions::'<'
    { in x: Rational[1]; in y: Rational[1]; return : Boolean[1]; }
function '>' specializes RealFunctions::'>'
    { in x: Rational[1]; in y: Rational[1]; return : Boolean[1]; }
function '<=' specializes RealFunctions::'<='
    { in x: Rational[1]; in y: Rational[1]; return : Boolean[1]; }
function '>=' specializes RealFunctions::'>='
    { in x: Rational[1]; in y: Rational[1]; return : Boolean[1]; }

function max specializes RealFunctions::max
    { in x: Rational[1]; in y: Rational[1]; return : Rational[1]; }
function min specializes RealFunctions::min
    { in x: Rational[1]; in y: Rational[1]; return : Rational[1]; }

function '==' specializes RealFunctions::'=='
    { in x: Rational[0..1]; in y: Rational[0..1]; return : Boolean[1]; }

function gcd
    { in x: Rational[1]; in y: Rational[1]; return : Integer[1]; }

function floor specializes RealFunctions::floor
    { in x: Rational[1]; return : Integer[1]; }
function round specializes RealFunctions::round
    { in x: Rational[1]; return : Integer[1]; }

function ToString specializes RealFunctions::ToString
    { in x: Rational[1]; return : String[1]; }
function ToInteger
    { in x: Rational[1]; return : Integer[1]; }
function ToRational
    { in x: String[1]; return : Rational[1]; }

function sum specializes RealFunctions::sum
    { in collection: Rational[0..*]; return : Rational[1]; }

function product specializes RealFunctions::product
    { in collection: Rational[0..*]; return : Rational[1]; }
```

9.4.11 Integer Functions

9.4.11.1 Integer Functions Overview

This package defines Functions on Integer values, including concrete specializations of the general arithmetic and comparison operations.

9.4.11.2 Elements

```
function abs specializes RationalFunctions::abs
    { in x: Integer[1]; return : Natural[1]; }

function '+' specializes RationalFunctions::'+'
    { in x: Integer[1]; in y: Integer[0..1]; return : Integer[1]; }
function '-' specializes RationalFunctions::'-'
    { in x: Integer[1]; in y: Integer[0..1]; return : Integer[1]; }
function '*' specializes RationalFunctions::'*'
    { in x: Integer[1]; in y: Integer[1]; return : Integer[1]; }
function '/' specializes RationalFunctions::'/'
    { in x: Integer[1]; in y: Integer[1]; return : Rational[1]; }
function '**' specializes RationalFunctions::'**'
    { in x: Integer[1]; in y: Natural[1]; return : Integer[1]; }
function '^' specializes RationalFunctions::'^'
    { in x: Integer[1]; in y: Natural[1]; return : Integer[1]; }
function '%' specializes NumericalFunctions::'%'
    { in x: Integer[1]; in y: Integer[1]; return : Integer[1]; }

function '<' specializes RationalFunctions::'<'
    { in x: Integer[1]; in y: Integer[1]; return : Boolean[1]; }
function '>' specializes RationalFunctions::'>'
    { in x: Integer[1]; in y: Integer[1]; return : Boolean[1]; }
function '<=' specializes RationalFunctions::'<='
    { in x: Integer[1]; in y: Integer[1]; return : Boolean[1]; }
function '>=' specializes RationalFunctions::'>='
    { in x: Integer[1]; in y: Integer[1]; return : Boolean[1]; }

function max specializes RationalFunctions::max
    { in x: Integer[1]; in y: Integer[1]; return : Integer[1]; }
function min specializes RationalFunctions::min
    { in x: Integer[1]; in y: Integer[1]; return : Integer[1]; }

function '==' specializes DataFunctions::'=='
    { in x: Integer[0..1]; in y: Integer[0..1]; return : Boolean[1]; }

function '..' specializes ScalarFunctions::'..'
    { in lower: Integer[1]; in upper: Integer[1]; return : Integer[0..*]; }

function ToString specializes RationalFunctions::ToString
    { in x: Integer[1]; return : String[1]; }
function ToNatural
    { in x: Integer[1]; return : Natural[1]; }
function ToInteger
    { in x: String[1]; return : Integer[1]; }

function sum specializes RationalFunctions::sum
    { in collection: Integer[0..*]; return : Integer[1]; }

function product specializes RationalFunctions::product
    { in collection: Integer[0..*]; return : Integer[1]; }
```

9.4.12 Natural Functions

9.4.12.1 Natural Functions Overview

This package defines Functions on Natural values, including concrete specializations of the general arithmetic and comparison operations.

9.4.12.2 Elements

```
function '+' specializes IntegerFunctions::'+'
    { in x: Natural[1]; in y: Natural[0..1]; return : Natural[1]; }
function '*' specializes IntegerFunctions::'*'
    { in x: Natural[1]; in y: Natural[1]; return : Natural[1]; }
function '/' specializes IntegerFunctions::'/'
    { in x: Natural[1]; in y: Natural[1]; return : Natural[1]; }
function '%' specializes IntegerFunctions::'%'
    { in x: Natural[1]; in y: Natural[1]; return : Natural[1]; }

function '<' specializes IntegerFunctions::'<'
    { in x: Natural[1]; in y: Natural[1]; return : Boolean[1]; }
function '>' specializes IntegerFunctions::'>'
    { in x: Natural[1]; in y: Natural[1]; return : Boolean[1]; }
function '<=' specializes IntegerFunctions::'<='
    { in x: Natural[1]; in y: Natural[1]; return : Boolean[1]; }
function '>=' specializes IntegerFunctions::'>='
    { in x: Natural[1]; in y: Natural[1]; return : Boolean[1]; }

function max specializes IntegerFunctions::max
    { in x: Natural[1]; in y: Natural[1]; return : Natural[1]; }
function min specializes IntegerFunctions::min
    { in x: Natural[1]; in y: Natural[1]; return : Natural[1]; }

function '==' specializes IntegerFunctions::'=='
    { in x: Natural[0..1]; in y: Natural[0..1]; return : Boolean[1]; }

function ToString specializes IntegerFunctions::ToString
    { in x: Natural[1]; return : String[1]; }
function ToNatural
    { in x: String[1]; return : Natural[1]; }
```

9.4.13 Trig Functions

9.4.13.1 Trig Functions Overview

This package defines basic trigonometric functions on real numbers.

9.4.13.2 Elements

```
feature pi : Real;
inv piPrecision { RealFunctions::round(pi * 1E20) == 314159265358979323846.0 }

function deg {
    in theta_rad : Real[1];
    return : Real[1] = theta_rad * 180 / pi;
}
function rad {
    in theta_deg : Real;
    return : Real[1] = theta_deg * pi / 180;
}

datatype UnitBoundedReal :> Real {
```

```
    inv unitBound { -1.0 <= that & that <= 1.0 }
}

function sin {
    in theta : Real[1];
    return : UnitBoundedReal[1];
}
function cos {
    in theta : Real[1];
    return : UnitBoundedReal[1];
}
function tan {
    in theta : Real[1];
    return : Real = sin(theta) / cos(theta);
}
function cot {
    in theta : Real;
    return : Real = cos(theta) / sin(theta);
}

function arcsin {
    in x : UnitBoundedReal[1];
    return : Real[1];
}
function arccos {
    in x : UnitBoundedReal[1];
    return : Real[1];
}
function arctan {
    in x : Real[1];
    return : Real[1];
}
```

9.4.14 Sequence Functions

9.4.14.1 Sequence Functions Overview

This package defines Functions that operate on general sequences of values. (For Functions that operate on Collection values, see CollectionFunctions.)

9.4.14.2 Elements

```
function equals{
    in x: Anything[0..*] ordered nonunique;
    in y: Anything[0..*] ordered nonunique;
    return : Boolean[1];
}

function size{
    in seq: Anything[0..*] nonunique;
    return : Natural[1];
}
function isEmpty{
    in seq: Anything[0..*] nonunique;
    return : Boolean[1];
}
function notEmpty{
    in seq: Anything[0..*] nonunique;
    return : Boolean[1];
}
```

```
function includes{
    in seq1: Anything[0..*] nonunique;
    in seq2: Anything[0..*] nonunique;
    return : Boolean[1];
}
function includesOnly{
    in seq1: Anything[0..*] nonunique;
    in seq2: Anything[0..*] nonunique;
    return : Boolean[1];
}
function excludes{
    in seq1: Anything[0..*] nonunique;
    in seq2: Anything[0..*] nonunique;
    return : Boolean[1];
}

function union{
    in seq1: Anything[0..*] ordered nonunique;
    in seq2: Anything[0..*] ordered nonunique;
    return : Anything[0..*] ordered nonunique;
}
function intersection{
    in seq1: Anything[0..*] ordered nonunique;
    in seq2: Anything[0..*] ordered nonunique;
    return : Anything[0..*] ordered nonunique;
}
function including{
    in seq1: Anything[0..*] ordered nonunique;
    in seq2: Anything[0..*] ordered nonunique;
    return : Anything[0..*] ordered nonunique;
}
function excluding{
    in seq1: Anything[0..*] ordered nonunique;
    in seq2: Anything[0..*] ordered nonunique;
    return : Anything[0..*] ordered nonunique;
}

function subsequence{
    in seq: Anything[0..*] ordered nonunique;
    in startIndex: Positive[1];
    in endIndex: Positive[1];
    return : Anything[0..*];
}
function head{
    in seq: Anything[0..*] ordered nonunique;
    return : Anything[0..1] = seq[1];
}
function tail{
    in seq: Anything[0..*] ordered nonunique;
    return : Anything[0..*] ordered nonunique;
}
function last{
    in seq: Anything[0..*] ordered nonunique;
    return : Anything[0..1];
}

function '[' specializes BaseFunctions::'[' {
    in seq: Anything[0..*] ordered nonunique;
    in index: Positive[1];
```

```
    return : Anything[0..1];
}
```

9.4.15 Collection Functions

9.4.15.1 Collection Functions Overview

This package defines Functions on Collections (as defined in the Collections package). For Functions on general sequences of values, see the SequenceFunctions package.

9.4.15.2 Elements

```
function '==' specializes BaseFunctions::'==' {
    in col1: Collection[0..1];
    in col2: Collection[0..1];
    return : Boolean[1];
}

function size {
    in col: Collection[1];
    return : Natural[1];
}

function isEmpty {
    in col: Collection[1];
    return : Boolean[1];
}

function notEmpty {
    in col: Collection[1];
    return : Boolean[1];
}

function contains {
    in col: Collection[1];
    in values: Anything[*];
    return : Boolean[1];
}

function containsAll {
    in col1: Collection[1];
    in col2: Collection[2];
    return : Boolean[1];
}

function head {
    in col: OrderedCollection[1];
    return : Anything[0..1];
}

function tail {
    in col: OrderedCollection[1];
    return : Anything[0..*] ordered nonunique;
}

function last {
    in col: OrderedCollection[1];
    return : Anything[0..1];
}
```

```
function '[' specializes BaseFunctions::'[' {
    in col: OrderedCollection[1];
    in index: Positive[1];
    return : Anything[0..1];
}

function 'array[' specializes BaseFunctions::'[' {
    in arr: Array[1];
    in indexes: Positive[n] ordered nonunique;
    return : Anything[0..1];
}
```

9.4.16 Vector Functions

9.4.16.1 Vector Functions Overview

This package defines abstract functions on *VectorValues* corresponding to the algebraic operations provided by a vector space with inner product. It also includes concrete implementations of these functions specifically for *CartesianVectorValues*.

9.4.16.2 Elements

```
abstract function isZeroVector {
    doc
    /*
     * Return whether a VectorValue is a zero vector.
     */

    in v: VectorValue[1];
    return : Boolean[1];
}

abstract function '+' specializes DataFunctions::'+' {
    doc
    /*
     * With two arguments, returns the sum of two VectorValues.
     * With one argument, returns that VectorValue.
     */

    in v: VectorValue[1];
    in w: VectorValue[0..1];
    return u: VectorValue[1];
    inv zeroAddition { w == null or isZeroVector(w) implies u == w }
    inv commutivity { w != null implies u == w + v }
}

abstract function '-' specializes DataFunctions::'-' {
    doc
    /*
     * With two arguments, returns the difference of two VectorValues.
     * With one arguments, returns the inverse
     * of the given VectorValue, that is, the VectorValue that,
     * when added to the original VectorValue, results in
     * the zeroVector.
     */

    in v: VectorValue[1];
    in w: VectorValue[0..1];
    return u: VectorValue[1];
```

```
    inv negation { w == null implies isZeroVector(v + u) }
    inv difference { w != null implies v + u == w }
}

abstract function sum0 {
    doc
    /*
     * Return the sum of a collection of VectorValues.
     * If the collection is empty, return a given zero vector.
     */

    in coll: VectorValue[*] nonunique;
    in zero: VectorValue[1];

10 Model Interchange

10.1 Model Interchange Overview

Model interchange is the capability to interchange models between tools using file-base resources (see Clause 2). The unit of interchange is the *project,* which is defined as follows:

> A project is a set of root namespaces (see 7.2.4.3 and 8.2.3.3.1), including all elements in the ownerhship trees of those namespaces, and a set of references to *used projects,* such that every cross reference from an element in the project is to another element in that project or to an element in one of the used projects.

The root namespaces in a project may be *serialized* into *model interchange files,* using any of the formats given in 10.2. A *project interchange file* is then a compressed archive of model interchange files and additional required metadata, as described in 10.3.

KerML is intended to be used as the basis for building other modeling languages. Project-based model interchange as defined in this clause may also be used to interchange models in such languages. Each of the following subclauses includes descriptions of the allowed adaptations for interchanging models in *KerML-based* languages.

10.2 Model Interchange Formats

A *model interchange file* contains a textual representation (known as a *serialization*) of a single root namespace (see 7.2.4.3 and 8.2.3.3.1) and all the elements in the ownership tree root in that namespace. A model interchange file shall have one of the following formats:

1. *Textual notation*, using the textual concrete syntax defined in this specification. Note that in certain limited cases, models conformant with the KerML syntax, but prepared by a means other than using the KerML textual concrete syntax, may not be fully serializable into the standard textual notation. In this case, a tool may either not export such model at all using the textual notation, or export the model as closely as possible, informing the user of any changes from the original model. A model interchange file in this format shall have the file extension `.kerml`.
2. *JSON*, using a format according to the JSON serialization mapping defined in 10.4. A model interchange file in this format shall have the file extension `.json`.
3. *XML*, using the XML Metadata Interchange [XMI] format based on the MOF-conformant abstract syntax metamodel for KerML. A model interchange file in this format shall have the file extension `.xmi`.

Every conformant KerML modeling tool shall provide the ability to import and/or export (as appropriate) models in at least one of the first two formats.

For a KerML-based language:

1. *Textual Notation.* If the language has a textual concrete syntax, then this textual notation may be used as a model interchange file format. The language shall define a distinguishing file extension for files of its textual notation.
2. *JSON.* It shall always be possible to use JSON format as a model interchange file format, using the mapping strategy defined in 10.4, as applied to the abstract syntax of the language.
3. *XML.* If the language is defined using a MOF-conformat abstract syntax, then XMI may be used as a model interchange file format.

A KerML-based-language specification may specify further requirements on what interchange formats must be supported by conforming language tools.

10.3 Model Interchange Projects

A *project interchange file* is contains a single project serialized as a set of model interchange files, archived using the ZIP format [ZIP]. The archive shall contain a model interchange file for each of the root namespaces in the project, each formatted in one of the formats listed in 10.2. In addition, the archive shall contain, at its top level, exactly one file named `.project` and exactly one file named `.meta`. A KerML project interchange file shall have the file extension `.kpar` (KerML Project Archive).

Other than the use of the file extensions given in 10.2, there are no requirements on the naming of the model interchange files. Nevertheless, they should be named in a way that is compatible across different file systems and that allows for easy reference using International Resource Identifiers (IRIs). The model interchange files may be organized into subdirectories, but this has no impact on the global scope for the project, which is always a flat namespace derived from the root namespaces of the project (see 8.2.3.3.4). However, each model interchange file shall be identifiable by a unique path in the archive directory structure.

The `.project` file shall contain the `InterchangeProject` information shown in Fig. 41, serialized in JSON format according to the rules given in 10.4, *without* the inclusion of derived properties (i.e., `usedProject` and `usingProject`), and with the type `IRI` treated as a string. Table 34 describes all the properties of the `InterchangeProject` and `InterchangeProjectUsage` elements. Every element referenced in a model interchange file in a project interchange file shall either also be contained in a model interchange file in that project interchange file, or in one of the projects referenced in the `usage` list for the project interchange file.

The `.meta` file shall contain further metadata on the project interchange file, formatted as a single JSON object containing the name/value pairs listed in Table 35.

A project interchange file for a KerML-based language will include model interchange files specific to that language (as described in Clause 10). Such a project interchange file may use the generic `.kpar` extension, or it may define its own language-specific extension. If it uses the `.kpar` extension, then the metadata for the file shall identify the KerML-based language metamodel (see Table 35). Each project interchange file shall only contain models in a single language, but it shall be able to have used projects both in the same language and in KerML (such as from the Kernel Model Libraries). A KerML-based-language specification may also allow for project interchange files that use projects in other KerML-based languages.

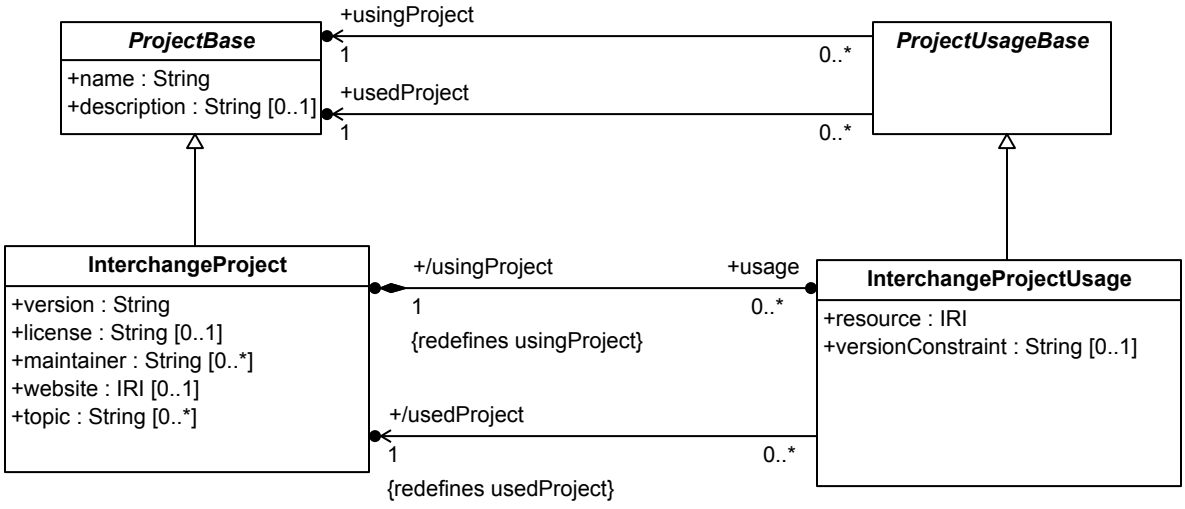

Figure 41. Interchange Projects

Table 34. Interchange Project Information

Property	Mandatory	Description
`name`	yes	The name of the project. This shall be the same as the name of the project interchange file, without the `.kerml` extension.
`description`	no	A description of the project.
`version`	yes	The version of the project being interchanged.
`license`	no	The license by which project content may be used.
`maintainer`	no	A list of names of maintainers of the project.
`website`	no	An IRI for a Web site with further information on the project.
`topic`	no	A list of topics relevant to the project.
`usage`	no	A list of `InterchangeProjectUsage` entries, one for each project used by the project being interchanged, with properties as given below.
`resource`	yes	An IRI identifying the project being used. If the IRI is dereferenceable, it should resolve to a project interchange file for the used project.
`versionConstraint`	no	A constraint on the allowable versions of a used project.

Table 35. Interchange Project Metadata

Name	Type	Mandatory	Description
`index`	object	yes	An index of the global scope of the project, specified as a JSON object with a key for each name, whose associated value is the path to the model interchange file containing the root namespace for the named element. (See Note 1.)
`created`	string	yes	The date and time of the creation of the project interchange file, in ISO 8601 format [ISO8601].

Name	Type	Mandatory	Description
`metamodel`	string	no	An IRI identifying the metamodel of the modeling language of the models being interchange in this project interchange file. (See Note 2.)
`includesDerived`	Boolean	no	Whether derived property values are included in the model interchange files. (See Note 3.)
`includesImplied`	Boolean	no	Whether implied relationships are included in the model interchange files. (See Note 4.)

Notes

1. The `index` cross-references all the non-null `shortNames` and `names` of all the top-level elements of the root namespaces of the project (see 7.2.4.3 and 8.2.3.3.4) to the model interchange file of the root namespace that contains the element. Note that, while the names of all top-level elements in a root namespace must be unique, it is allowable (though not recommended) for top-level elements in different root namespaces of a project to have the same name.
2. For an OMG-standardized language, `metamodel` shall be the version-specific URI specified by OMG to identify the language. For KerML, this URI has the form `https://www.omg.org/spec/KerML/yyyymmxx`, with a version-specific date stamp "`yyyymmxx`". If `metamodel` is not given, the default is KerML (for a project interchange file with the `.kpar` extension).
3. If `includesDerived = true`, then the serializations in all model interchange files in the project interchange file shall include values for all derived properties. If `includesDerived = false`, then the model interchanges files shall not include values for any derived properties. If `includesDerived` is not given, then whether derived property values are included may vary one model interchange file to another, and it is also allowable for some values to be included for some derived properties and not other.
4. If `includesImplied = true`, then the serializations in all model interchange files in the project interchange file shall include all implied relationships, and the `isImpliedIncluded` property shall have the value `true` for all elements (see 8.3.2.1 on `isImpliedIncluded`). If `includesImplied = false`, then the model interchange files shall not include any implied relationships, and the `isImpliedIncluded` property shall have the value `false` for all elements. If `includesImplied` is not given, then whether implied relationships are included may vary from one model interchange file to another, and from element to element, as recorded by the value of the `includesImplied` property for each element.

10.4 JSON Serialization

10.4.1 Serialization Overview

The JSON serialization format can be used to interchange any model conformant with the KerML abstract syntax. Each root namespace shall correspond with a model interchange file with the file extension `.json` and contain serializations of all model elements in the ownership tree root in that namespace. The contents of this file shall be in the JSON (JavaScript Object Notation) format [JSON] and conform to the JSON Schema definition accompanying this document. Other KerML-based languages may extend this schema or define their own schema, consistent with the serialization strategy defined here as applied to the abstract syntax of those languages.

The following subclauses describe the serialization strategy, consistent with the normative JSON Schema definition.

10.4.2 Primitive Type Serialization

The UML primitive types used in the KerML abstract syntax map directly to core JSON Schema types, as shown in Table 36.

Table 36. UML Primitive Type Serialization

UML Primitive Type	JSON Schema Type
Boolean	boolean
Integer	integer
Real	number
String	string

10.4.3 Enumeration Serialization

Enumeration values map to a JSON Schema `string` with a value that is the `name` of the enumeration literal, with the same capitalization as defined for the literal in the abstract syntax. For example, `VisibilityKind::public` maps to the string `"public"`.

10.4.4 Element Reference Serialization

Values of abstract syntax properties typed by a metaclass (that is, `Element` or one of its subclasses) map to a JSON Schema `object` with a single field `@id`. The value of `@id` is a JSON Schema `string` with a value equal to the value of the `elementId` of the `Element`. For example:

```
{
  "@id": "15fe7607-ceb8-38bb-bd04-dde8ca657cec"
}
```

10.4.5 Element Serialization

A model element maps to a JSON Schema `object` with fields `@id`, `@type`, and a set of its attributes. The field `@id` has a `string` value equal to the value of `Element::elementId`. The field `@type` has a `string` value equal to the `name` of the specific MOF type of the element, e.g. `"Structure"`.

The remaining JSON Schema fields are mapped from the set of MOF properties specified as attributes of the MOF type of the element. This shall include all owned and inherited properties. In addition, while redefined properties are *not* inherited under MOF/UML rules, they *shall* be included in the set of properties serialized for the element if they have a different name than the redefining property.

Each of these maps to a JSON Schema field, where the name of the field is equal to the name of the attribute and the value is equal to the serialization of the attribute value as described in the preceding subclauses. The value must adhere to the allowed multiplicity of the MOF attribute:

- A multiplicity of `[1..1]` requires a non-null value.
- A multiplicity of `[0..1]` allows a value or null
- A multiplicity with an upper bound greater than 1 maps to a JSON Schema `array` with values equal to the serialization of the attribute values described in the preceding subclauses.

10.4.6 Model Serialization

A root namespace maps to a JSON Schema `array` with values equal to the serialization, as described in the preceding subclauses, of all model elements in the ownership tree rooted in that namespace.

A Annex: Conformance Test Suite

Submission Note. The conformance test suite will be provided in the final submission.
