OMG

Founded in 1989, the Object Management Group, Inc. (OMG) is an open membership, not-for-profit computer industry standards consortium that produces and maintains computer industry specifications for interoperable, portable, and reusable enterprise applications in distributed, heterogeneous environments. Membership includes Information Technology vendors, end users, government agencies, and academia.

OMG member companies write, adopt, and maintain its specifications following a mature, open process. OMG's specifications implement the Model Driven Architecture[®] (MDA[®]), maximizing ROI through a full-lifecycle approach to enterprise integration that covers multiple operating systems, programming languages, middleware and networking infrastructures, and software development environments. OMG's specifications include: UML[®] (Unified Modeling Language[™]); CORBA[®] (Common Object Request Broker Architecture); CWM[™] (Common Warehouse Metamodel); and industry-specific standards for dozens of vertical markets.

Issues

All OMG specifications are subject to continuous review and improvement. As part of this process we encourage readers to report any ambiguities, inconsistencies, or inaccuracies they may find by completing the Issue Reporting Form listed on the main web page <https://www.omg.org>, under Specifications, Report an Issue.

1 Scope

This specification describes a transformation for a semantic translation from SysML v1 [SysMLv1] to SysML v2 [SysMLv2] in a precise way. (In this document, "SysML v1" refers to SysML v1.7, the last version of SysML prior to v2.0, and "SysML v2" refers to SysML v2.0, or whatever version corresponds to the current version of this specification.)

The main intent is to provide the rules on which automated conversions of SysML v1 models to the SysML v2 standard can be developed. In addition, this annex can be considered an educational document that provides useful information for people who would like to compare using SysML v2 and using SysML v1.

More sophisticated applications of this transformation can also be envisaged. For instance, a SysML v1 conformant tool could use this transformation to implement a limited subset of the SysML v2 API that will provide "SysMLv2-like" read-only access to its SysMLv1 models for external applications.

2 Conformance

A tool shall demonstrate *conformance* with this specification by meeting all of the following requirements.

1. The tool shall implement the UML4SysML abstract syntax and SysML v1 profile conformant with [SysMLv1]. The tool should, but is not required, to provide the ability to import a SysML v1 model using standard XMI Model Interchange format [XMI].
2. The tool shall implement the SysML v2 abstract syntax conformant with [SysML v2]. The tool should, but is not required, to provide the ability to export a SysML v2 model KerML-standard model interchange project (see [KerML], Clause 10; see also [SysML v2], Clause 2).
3. The tool shall implement a transformation from an abstract syntax representation of an input SysML v1 model to the abstract syntax representation of an output SysML v2, as specified in view link does not exist of this specification.

A tool may claim *partial conformance* with this specification by satisfying the first two requirements above, but only implementing an identified subset of the mappings specified in view link does not exist and view link does not exist . (Note that care must also be taken that certain mappings depend on other mappings, and so cannot reasonably be implemented separately.)

Note. A tool that conforms to [SysMLv2] is not required to necessarily implement a transformation conformant with this specification, or it may implement a SysML v1 to v2 transformation that is not claimed to conform with the transformation defined in this specification.

6 Introduction

6.1 Mapping Approach

The SysML v1 to v2 transformation is specified by directional mappings between UML metaclasses or stereotypes that are part of the SysML v1 specification [SysMLv1] (referenced below as the "SysML v1 scope") on the one hand, and the set of the metaclasses defined in the KerML [KerML] and SysMLv2 [SysMLv2] specifications (referenced below as "SysML v2") in the other hand. Some library classes are also involved.

Each mapping is a directed relationship that reifies a semantic link between a concept belonging to the SysML v1 scope on the source side and one concept belonging to SysML v2 (or one conforming library element) on the target side. As a set, those mappings constitute a declarative specification of a formal transformation that describes how the information encoded by the SysML v1 concepts can be reliably represented using constructs of SysML v2 metaclass instances.

In this approach, a mapping is represented by a UML class that has a pair of associations. One provides the `from` end that designates the source SysML v1 concept, while the other provides the `to` end that designates the target SysML v2 metaclass.

In addition to those associations, a mapping class provides a set of operations defining how the values of non-derived properties of the target metaclass instance have to be computed based on property values reachable from the source object. The computation algorithm is provided by the body condition of those operations and expressed using OCL code.

Note that the values assigned to the properties of the target object shall be instances of SysML v2 metaclasses, coming themselves from transformations of SysMLv1 objects to SysMLv2 objects. Since the specification is declarative, the order in which the individual transformations shall happen is not imposed. It is up to a conforming implementation to deal with this. Instead, the `getMapped` static operation is provided for referring to the result of a transformation from within an OCL rule. It returns a (possibly undefined) value, that is typed by the target metaclass of the mapping class from which it is invoked.

Each mapping class enables the transformation of any object that has the type specified by the `from` role to an object of the type specified by the `to` role, as long as it is not overloaded by a more specific mapping definition. In other words, assume a mapping is specified for the class A (i.e., it has A typing its `from` property), then it applies to any instance of a class B if B is a subclass of A and if there is no specialization of that mapping class specified for B (i.e., that has B typing its `from` property).

It is possible to restrict the applicability of a mapping specification to a specific subset of objects. This is achieved by the `filter` static operation that is evaluated against each candidate object. Only objects of the appropriate type for which this `filter` operation returns `true` shall be translated according to the specifications of that mapping class. The default `filter` operation always returns `true`.

Some mapping classes have one or more qualifiers for their `to` attribute. In such a case, each of those qualifiers reflects the specific property of the source type (i.e. the type of the `from` attribute) that has the same name and the same type. For those specific mappings, it is expected to get one instance of the target class (as specified by the type of the `to` attribute") for each actual combination of value of those properties for a given instance of object of the source type, assuming they pass the applicability filter as described above.

7 Mappings

7.1 Overview

This Clause is organized in order to match the packages that subdivide the model of the transformation. The `Foundations` package gathers the abstract classes that represent the concepts on top of which the mapping approach is built. The next subclause presents a utility class named `Helper` that provides reusable operations that simplify the OCL statements defining the computation rules of target properties and make them more readable. Libraries play an important role in SysML v2, and a specific one has been created in order to represent semantics equivalent to those of UML/SysML concepts, where needed. It is presented in this subclause as well.

The three next subclauses are dedicated to initializers, factories and generic mappings, respectively. They do not specify mappings, strictly speaking. Instead, they factorize more or less advanced OCL code that will be reused by the actual mapping specifications that are contained in the two last subclauses. The first of them is dedicated to UML metaclass from the UML4SYSML scope, while the second deals with SysML stereotypes more specifically.

7.2 Foundations

7.2.1 Overview

The concepts defined by KerML/SysML v2 are relatively similar to those of UML/SysML v1, but the ways they are built are different. This makes the specification of the global transformation quite complex. In order to keep it manageable, specific kinds of foundational classes are provided. They represent concepts on which classical "model to model" transformation technologies rely:

- The mappings built on top of the abstract class `Mapping` shall be executed only when they are explicitly called. Each call shall produce a new target element, whatever the source element. It specifies a `from` property typed by the `UML::CommonStructure::Element` metaclass that shall be redefined by any of its subclass for specifying the convenient type of source element. Also it specifies a default (neutral) filter and a set of `getMapped` operations for various purposes: regular mapping result, qualified mapping result and mapping result for a collection of elements.
- The mappings built on top of the abstract class `UniqueMapping`, specified as a specialization of the `Mapping` class, shall produce only one target element for a given source element, whatever the number of time they are called.
- The mappings built on top of the abstract class `MainMapping`, specified as a specialization of the `UniqueMapping` class, shall be systematically executed (i.e. implicitly called) for all the elements that match both their source type and filter. There can be at most one main mapping for a given source type and only one target element shall be produced for a given source element.

The corresponding classes are located in the `Foundations` package.

Sometimes, it is necessary to be able to generate elements in the target model without having to provide an explicit link with a source element. In such a case, a mapping class is not appropriate. Instead the mapping framework provides the concept of a `Factory`.

Last, the concept of an `Initializer` allows the factorization of the specification of properties' default values that can be inherited by mappings and factories, as convenient.

In the model of the transformation that is specified here, all of the abstract classes of this `Foundations` package are subject to direct or indirect subclassing. In other words, this specification is built as a set of interrelated initializers, factories, regular, unique and main mappings, where the initializers' operation factorizes the specification of default

values for their target element, wherever possible. Those "default operations" are either used as-is or redefined by mappings or factories that can inherit for a specific initializer, as appropriate.

7.2.2 Foundational class specifications

7.2.2.1 UniqueMapping

Description

The mappings built on top of the abstract class UniqueMapping are a specific kind of Mappings that are intended to produce only one target element for a given source element, whatever the number of time they are called. If a getMapped is called several time with the same source element, the target element returned shall always be the same.

Generalizations

- Mapping (from Foundations)

7.2.2.2 Factory

Description

Similarly to the well-known to the homonyms software design pattern, a Factory can be used for specifying the production of a target element without any link with a source element. Factories have in common with mapping classes the operations that specify how the properties of the target element shall be computed and the "to" property that specifies the type of the target element. However factories do not define source element. Instead, they can have parameters. Those parameters, if any, shall be specified by properties with appropriate types and multiplicities. Factories are expected to provide a "create" operation with parameters matching in type and multiplicity the properties that are intended to specify them.

Generalizations

- Initializer (from Foundations)

7.2.2.3 Mapping

Description

This is the generic abstract class that provides the basic features of any mapping class mapping. The mappings built on top of the abstract class Mapping are intended to be executed only when explicitly called (e.g. by the rule of another mapping class). It specifies a "from" property typed by the UML::CommonStructure::Element metaclass that shall be redefined by any of its subclass for specifying the convenient type of source element. Also it specifies a default (neutral) filter and a set of getMapped operations for various purposes: regular mapping result, qualified mapping result and mapping result for a collection of elements. Each call to the getMapped operation shall produce a new target element, whatever the source element provided. Instances of Mapping class are represent a link between one source element and the target element produced by the transformation specified by that mapping class.

Generalizations

- Initializer (from Foundations)

Association Ends

- from : Element [1]

Operations

- `filter (in src : Element) : Boolean [1]`
returns "true" if the element provided as the actual parameter value can have a mapping to an instance of the type specified by the "to" attribute (i.e. can be used as a value for the "from" attribute)

```

- `getMapped (in fromVar : Element) : Element [1]`

postConditions:

```
self.filter(fromVar) and

    ->selectByKind(UML::Operation)->any(o | o.name = p.name) in
    p = ops()) and
result = self.to
```

- `getMapped (in fromVar : Element, in qual : Element) : Element [1]`

postConditions:

```
self.filter(fromVar) and
self.to.allFeatures()->selectByKind(UML::Property)->reject(isDerived)
->forAll(p | let ops: Operation = self.allFeatures()
    ->selectByKind(UML::Operation)->any(o | o.name = p.name) in

            p = ops(qual)
        else if ops.ownedParameter
            ->select(p | p.direction = UML::ParameterDirectionKind::_'in')
            ->size()=0 then
                p = ops()
            else
                invalid
            endif endif) and
result = self.to
```

- `getMappedColl (in fromColl : Element) : Element [0..*]`

postConditions:

```
result = fromColl->collect(e | self.getMapped(e))
```

7.2.2.4 MainMapping

Description

The mappings built on top of the abstract class MainMapping are a specific kind of UniqueMappings class that are always implicitly called for any element in the source model that match both their source type (as specified by their

"from" property) and their filter condition. If more than one main mapping is specified for a given source type, they shall have filters that specify mutually exclusive conditions. Also, as with any unique mapping, only one target element shall be produced for a given source element.

Generalizations

- UniqueMapping (from Foundations)

7.2.2.5 Initializer

Description

The abstract class Initializer is the common ancestor of Mapping and Factory. It specifies a "to" property typed by the KerML::Root::Element metaclass that shall be redefined by any of its subclass for specifying the convenient type of target element. Initializers are intended to specify reusable properties' computation rules, mainly for initializing them with default values. Those rules will be inherited or redefined by the sub-classes, as appropriate.

7.4 Initializers

7.4.1 Overview

The classes presented in this subclause provide set of rules that provide default values for all non-derived features of their target metaclasses. Intentionally, initializers do not specify any "source" element. This makes them easier to specialize but prevents them from being able to provide a computation algorithm for some target features. In such a case, the operation matching the feature will be specified as abstract.

7.6 Generic Mappings

7.6.1 Overview

Generic mappings are partial definitions of transformation rules that are intended to factorize reusable algorithms for making the global specification more compact and easier to read and maintain. Basically, they provide a default value for all the non-derived attributes of their target metaclass wherever possible, or declare an abstract operation for them otherwise. They are similar to initializers, except that they have a source element defined. The operations provided by the generic mappings can be redefined by their specialization, as appropriate according to the source type specified by the redefinition of their `from` attribute.

All of these generic mappings are abstract.

7.7 Mappings from UML4SysML metaclasses

7.7.1 Overview

UML4SysML is the subset of UML containing all model elements that are reused by SysML. The complete list of model elements is defined in [SysMLv1], subclause 4.1.

7.7.2 Actions

This chapter lists all mapping specifications of UML4SysML::Actions model elements.

7.7.2.1 Overview

[SYSML2-441](#): Change the table header of the overview tables in the mapping class specification chapters
[SYSML2-564](#): Mapping tables in the overview sections show duplicates in the SysML v2 column

The following table gives an overview of which SysML v2 elements the UML4SysML::Actions elements are transformed with which mapping class. The mapping details are in [7.7.2.3](#).

The justifications for the elements without mapping are given in [7.7.2.2](#).

7.7.2.2 UML4SysML::Actions elements not mapped

In this section, missing transformation rules of SysML v1 elements to SysML v2 are justified for each individual element in the following table.

[SYSML2-566](#): Section containing tables about elements not mapped should get an introductory text

Table 2. List of SysML v1 elements not mapped of this section

SysML v1 Concept	Rationale
AcceptCallAction	Since the CallEvent is not supported by SysML v2, the AcceptCallAction is also not covered. It is mapped to an empty action usage to keep the connections within the activity respectively action definition.
ActionInputPin	The UML4SysML::ActionInputPin concept is not covered by SysML v2. The model element is mapped as a input or output pin, but without the special action input pin semantics.
Clause	Mapping is not specified yet.
ConditionalNode	Mapping is not specified yet.
LinkEndCreationData	Mapping is not specified yet.
LinkEndData	Mapping is not specified yet.
LinkEndDestructionData	Mapping is not specified yet.

SysML v1 Concept	Rationale
ReclassifyObjectAction	The UML4SysML::ReclassifyObjectAction is not supported by SysML v2. It is mapped to an empty action usage to keep the connections within the activity respectively action definition.
ReplyAction	The UML4SysML::ReplyAction is only used with UML4SysML::AcceptCallAction. Since we have no mapping of AcceptCallAction to SysML v2, there is also no mapping for ReplyAction. However, it is mapped to an empty action usage to keep the connections within the activity respectively action definition.
StartClassifierBehaviorAction	The UML4SysML::StartClassifierBehaviorAction is not supported by SysML v2. It is mapped to an empty action usage to keep the connections within the activity respectively action definition.
StartObjectBehaviorAction	The UML4SysML::StartObjectBehaviorAction is not supported by SysML v2. It is mapped to an empty action usage to keep the connections within the activity respectively action definition.
UnmarshallAction	Mapping is not specified yet.

[SYSML2-246](#): AEAParameterMembership_Mapping::ownedMemberParameter cannot return OclUndefined

Description

The UML4SysML::AcceptEventAction is mapped to a AcceptActionUsage element.

If the trigger is a signal, it is mapped to an accept parameter typed by the signal.

SysMLv2 does not support more than one trigger. Therefore only the first specified trigger of the action is transformed. All further triggers are ignored.

The following shows an example of what the textual SysML v2 syntax of the result of the transformation may look like.

```
action acceptEventActionSignalEvent1 accept : SysMLv1Signal via sysMLv1Port;
action acceptEventActionChangeEvent1 accept when when changeExpression.result {
    calc changeExpression {
        return : ScalarValues::Boolean;
        language "OCL"
        /*
         * x > 0
         */
    }
}
```

[SYSML2-441](#): Change the table header of the overview tables in the mapping class specification chapters

[SYSML2-564](#): Mapping tables in the overview sections show duplicates in the SysML v2 column

The following table gives an overview of which SysML v2 elements the UML4SysML::Activities elements are transformed with which mapping class. The mapping details are in [7.7.3.3](#).

The justifications for the elements without mapping are given in [7.7.3.2](#).

[SYSML2-566](#): Section containing tables about elements not mapped should get an introductory text

Table 4. List of SysML v1 elements not mapped of this section

SysML v1 Concept	Rationale
ActivityFinalNode	Mapping is not specified yet.
ActivityParameterNode	The parameter of the activity is mapped from SysML v1 to SysML v2. The additional concept of the activity parameter node is necessary for the token semantic of SysML v1 activities, which is not part of SysML v2. Therefore, the additional concept of the activity parameter node is not mapped to SysML v2.
ActivityPartition	Mapping is not specified yet.
ExceptionHandler	Mapping is not specified yet.
InterruptibleActivityRegion	Mapping is not specified yet.

7.8 Mappings from SysML v1.7 stereotypes

7.8.1 Overview

The following subclauses of Mappings from SysML v1.7 stereotypes are organized according to the main packages of SysML v1.

7.8.2 Activities

This chapter lists all mapping specifications of SysML::Activities model elements.

7.8.2.1 Overview

[SYSML2-441](#): Change the table header of the overview tables in the mapping class specification chapters

The following table gives an overview of which SysML v2 elements the SysML::Activities elements are transformed with which mapping class. The mapping details are specified in [7.8.2.3](#).

The justifications for the elements without mapping are given in [7.8.2.2](#).

Table 22. List of all mappings

SysML v1 Abstract Syntax/Stereotype	SysML v2 Abstract Syntax
Continuous	MetadataUsage
ControlOperator	
Discrete	MetadataUsage
NoBuffer	
Optional	
Overwrite	
Probability	MetadataUsage

SysML v1 Abstract Syntax/Stereotype	SysML v2 Abstract Syntax
Rate	MetadataUsage

7.8.2.2 SysML::Activities elements not mapped

In this section, missing transformation rules of SysML v1 elements to SysML v2 are justified for each individual element in the following table.

[SYSML2-566](#): Section containing tables about elements not mapped should get an introductory text

Table 23. List of SysML v1 elements not mapped of this section

SysML v1 Concept	Rationale
ControlOperator	The concept that an action can control other actions is not supported by SysML v2.
NoBuffer	Mapping is not specified yet.
Optional	The stereotype states that the lower multiplicity of the parameter is 0. Since the multiplicity of the parameter is transformed, the additional statement that the parameter is optional is redundant. Therefore, the stereotype is not considered in the transformation.
Overwrite	Mapping is not specified yet.

[SYSML2-566](#): Section containing tables about elements not mapped should get an introductory text

Table 27. List of SysML v1 elements not mapped of this section

SysML v1 Concept	Rationale
AdjunctProperty	The concept of adjunct properties is not needed in SysML v2, where the principal of the adjunct property can be used directly in the appropriate place.
BoundReference	Mapping is not specified yet.
ClassifierBehaviorProperty	The classifier behavior is already mapped to a property which also plays the role of the classifier behavior property. Therefore, there is no explicit mapping of a classifier behavior property.
ConnectorProperty	The connector property is a special case of an adjunct property and is not mapped, just like the adjunct property.
DirectedRelationshipPropertyPath	The stereotype is abstract is therefore not mapped. The concept of the DirectedRelationshipPropertyPath is included in the SysML v2 language.
DistributedProperty	Mapping is not specified yet.

SysML v1 Concept	Rationale
ElementPropertyPath	The stereotype is abstract is therefore not mapped. The concept of the ElementPropertyPath is included in the SysML v2 language.
EndPathMultiplicity	Mapping is not specified yet.
NestedConnectorEnd	The concept of NestedConnectorEnd is already included in the SysML v2 language. It is not required to do an explicit mapping.
ParticipantProperty	Mapping is not specified yet.
PropertySpecificType	Mapping is not specified yet.
